There is a strong prejudice against leaving baby food leftovers in metal cans and it should be ascertained if this condition would be overcome by use of the new style container. A recent survey made by Benton and Bowles indicated that 86% of the buyers interviewed felt that a glass jar after being opened is the most sanitary container for leftovers. About 80% felt it was unsafe to leave unused portions of food in cans. This is one of the principal objections to the metal can as a baby food container. The white inside enamel may be helpful in correcting this thinking. Does it have other advantages than "looks more sanitary."	Current thinking favors glass jar.	Consumer reaction to white inside can enamel must be determined.

[fol. 1075]

Specific Consumer Preferences, Prejudices and Opinions	4¾ Oz. Glass Jar	Reclosure Cover Can
Visibility of Contents	The glass jar will continue to have the advantage of indicating the quantity of left overs in the container.	———
Easy to Open—No Can Opener Needed The new can closure is an improvement over the present open top can. However, it is not as easily pried off as the cap on the glass jar. However, this difference could probably be corrected. This form of construction raises the point as to the possibility of a curious buyer opening the can to see its contents which are visible in the glass jar.	Assume both to be equal	Assume both to be equal
Reclosure Feature	Assume both to be equal	Assume both to be equal
Heat in Container	———	Food in the can should heat more quickly than in the glass jar; being metal and having a larger exposed area.

[fol. 1076]

Specific Consumer Preferences, Prejudices and Opinions	4¾ Oz. Glass Jar	Reclosure Cover Can
Feed From Container or Easy to Feed From		
The current containers due to their small diameter and heighth fit the hand, spill very little and are easy to feed from. The shorter heighth and larger diameter of the new can should be checked for these features.		
Easy to Dispose of—Easy to Use When Travelling		Favorable to new style can
No breakage or glass particles		Favorable to new style can
No tin plate slivers due to opening as with present open top can		Favorable to new style can
Contents not affected by sunlight		Favorable to new style can
No Rusting of Inside Container	Claimed as favorable to jars	
No Taste or Odor due to Enamel Coatings	Claimed as favorable to jars	
Product Background		
Glass forms a neutral or accepted background for many vary-colored food products. The white enamel background in the can should be checked against the various products packed and also as a background for leftovers.		
Comparative Retail Prices	On an equal retail price basis we believe consumers would buy glass jars since they are accustomed to paying a premium for glass packs.

Detroit Hollywood Los Angeles
New York Minneapolis Pittsburgh
San Francisco

[fol. 1078] Report of Consumer Survey

Made in Philadelphia on Baby Food for
Continental Can Company, Inc.

Foreword

The findings in this report are based upon the results of making personal interviews on a total of 2003 young mothers whose babies range in age from three to fourteen months. The field work was conducted during the latter part of March 1946.

Kinds of Persons Interviewed:

The interviews were confined to women who are mothers of babies of an age to be fed prepared baby food—three to fourteen months of age.

Reporters judged the income of the families called upon and, as will be noted in Table #11, the spread by income groups comprises a sound cross-section.

By age groups, 41 per cent of the mothers are under 25 years of age, 58 per cent between 25 and 40 years and 1 per cent are over 40 years of age.

[fol. 1079] Method of Interviewing:

The calls were made in the home by trained female reporters in the employ of Fact Finders Associates, whom we engaged to conduct the field work. Experienced supervisors check the work of the field force. Fact Finders Associates have been employed by us on many surveys over a period of years and we have complete confidence in the reliability of their field staff.

In order to locate mothers with babies, the reporters had a list of such families. Addresses were selected at random from this list in various sections of the city and suburbs, called upon and on completion of the interview, respondent was usually able to guide the reporter to another young mother's home in the neighborhood.

A copy of the questionnaire used will be found following the tables and charts.

Scope of the Survey:

Interviews were made in Philadelphia and environs. They were widely spread over the city and in outlying sections such as; Camden, Germantown, North and West Philadelphia, etc. A list of the areas covered is shown in Table #8.

[fol. 1080] Objectives of the Study:

This study was planned to obtain information on the relative use of brands and the attitude of women toward the use of tin cans versus glass as containers for baby food. The principal purpose of making the survey at this time was to obtain the information prior to starting an advertising and promotion campaign in this territory. The results of this study will be used as a base for comparison with a comparable survey that will be made at the close of the campaign in order to measure the penetration and effectiveness of the advertising activities; (1) on brand sales and (2) on mothers' preference for types of containers and the degree to which they have been influenced to switch to tin cans.

The follow-up survey at the close of the campaign will be a matched sample—interviewing as many of the same mothers as can be contacted and the same series of questions will be asked with possibly some additional questions on knowledge of baby food advertising that has run during the interim.

[fol. 1081] Summary:

The results of the survey are shown in complete detail on the tables and charts following and this summary will touch only on the high-spots.

Every woman has bought one or more products in both tin cans and glass containers and they are, therefore, qualified to give an honest opinion for preference for type of containers and the reasons for their choice.

Eight out of every ten of the mothers interviewed have bought baby food in tin cans but if they had their choice of containers at no extra cost, less than one out of ten would take the tin can. With some variations this same relative

situation exists with all the other kinds of products discussed in the study.

On brands of baby food used at present, Heinz and Beechnut are used by 53 and 51 per cent respectively, Gerber is in third place, mentioned by 38 per cent and following, in the order named, are Clapp 22 per cent, Libby 16 per cent, Campbell 15 per cent and "Other Miscellaneous Brands" 5 per cent.

[fol. 1082] When brands used are analyzed according to economic status of the family, some significant variations are indicated. For example, Heinz, Beechnut and Libby are purchased by larger proportions of the upper economic groups than of the lower. The reverse is true of Gerber's, Clapp's and Campbell. These three brands are used by heavier proportions of the lower economic groups than by mothers in the top brackets.

Multiple buying of brands is very heavy, 72 per cent of the total mothers use more than one brand. The average number of brands used is two per family.

Of the 28 per cent of the total mothers using one brand exclusively, 9 per cent buy Heinz, 8 per cent Beechnut, 7 per cent Gerber, 2 per cent Libby and 1 per cent each use Clapp and Campbell.

In connection with multiple brand buying, which is shown in detail in Table #5b, Heinz and Beechnut are in the best position.

For example, of the total users of Beechnut, 30 per cent also use Gerber while of those using Gerber, 40 per cent also buy Beechnut.

A more extreme case is with Heinz users, only 19 per cent of whom also buy Clapp while of the Clapp users, 46 per cent also use Heinz.

[fol. 1083] This analysis also shows that 58 per cent of the Clapp users also buy Gerber while only 33 per cent of the Gerber users also buy Clapp.

Of the mothers now using Clapp's and Gerber's baby food, (which they get in tin cans) only 18 and 15 per cent respectively prefer tin containers. Six mothers out of ten using these brands prefer glass and two out of ten have no preference.

Of the women buying glass packed baby foods, less than

5 per cent prefer tin and only some ten per cent have no choice. Over 85 per cent prefer glass.

It is apparent that the habit of buying in tins has some effect in influencing women in favor of tin cans but it is very slight.

By economic groups there is a gradual increase in the proportion of women preferring tin for baby foods of from 6 per cent in the "A" or top bracket to 12 per cent in the "E" or lowest economic group.

Nearly all of the tables and charts are broken down according to economic status and age groups and, it will be noted, that with some few exceptions there are no significant variations.

Respectfully submitted, Batten, Barton, Durstine & Osborn, Inc.

May 3, 1946.

Reclosure Baby Food Can

Relationship Between Market Acceptability Information and Contemplated Can Developments

I. Feeding from Container and Storage of Food

The outstanding and major reasons for consumers preferring glass jars instead of metal cans for baby food is the deep seated belief that jars are completely sanitary containers which can be used in place of dishes for feeding and are also ideal for storing unused portions of food in a refrigerator while conventional cans are not suitable for either direct feeding use or storage of partial contents. The fear of storing unused portions of food in cans is related to the conviction that "tin" is poisonous and that there is a distinct health hazard in eating food that has been stored in an opened can.

A. White Enamel Lining of Cans

The proposition of providing a can having a white enamel lining to create the reaction that a metal can is clean, sani-

tary, and safe vessel for foods is certainly logical. The value of using such a lining would be greatly enhanced through the use of an identifying name for the lining such as "Porcelainite", "Sani-White", etc. which could be used in advertising in conjunction with a general campaign to educate the public to the fact that food may be as safely stored in cans as in jars.

B. Opening Size of Container

One of the few objections to the glass jars was that the opening was too small making it difficult to remove the contents. Actually it is felt that the inside "shelf" of the jar which is the result of necking in the top of the jar is responsible for this reaction rather than the dimensions of the opening. In either event this is an objection which would not exist with the Trutite, Conoseal or Screw Cap cans.

C. Feeding Directly from Cans

Due to the great convenience when baby food is heated in the container and is fed without transferring to a dish or bowl, this important attribute of the glass jar cannot be [fol. 1085] overlooked in designing a suitable can. Here again, the Trutite, Conoseal or Screw Cap can styles all involve almost straight body walls making them suitable as feeding containers although the Trutite structure does not completely fulfill the requirement of a smooth inside surface. It would seem that a major point of concern might be the resistance of the enamel lining to scratching, particularly along the side seam, when a spoon is scraped across the surface during feeding. Here again, the double body fold of the Trutite can would not provide as good assurance against removal of enamel lining as would a can having an uninterrupted body wall.

D. Lithograph vs. Paper Label

Associated with either direct feeding from the container or when the contents are transferred to a dish, most consumers have found it convenient to plate jars in hot water for heating purposes. Paper labeled jars have been criticized because the labels have come off in the heating water and have been a nuisance to remove from the water and in

addition the residual label glue remaining on the jar surface has caused difficulty in handling by causing hands to become soiled and also by resulting in dropped jars. Certainly a lithographed can would overcome these particular objections to jar labels.

E. Raw Edges

Obviously, any raw edges that might lead to corrosion problems inside the container or which might cause the person opening a can to receive finger cuts, are to be avoided. The presence of cut edges that are formed during opening, in standard open top cans, are further objectionable in baby food cans in that the containers may not be placed in the hands of the babies due to the hazard of cuts. The hinged Trutite structure does not fulfill this requirement but both the Conoseal with the hemmed edge cover and the [fol. 1086] Screw cap type cans do meet the desired condition. (The question of how much of a cutting hazard is present during opening of a Conoseal can has not been established.)

II. Ease of Opening and Security of Reclosure

A major feature of the preference of white cap jars over conventional cans is the relative ease of removing the lid from jars with almost any of the implements found in the kitchen as compared to the problems in using either a wall type of portable can opener with the attendant problems of removing dirt and dust from the can end, having the end drop into the product, cutting fingers while trying to pull end up, etc. As to the reclosure, one objection to the jar cap is that it is frequently deformed during removal and therefore fails to provide a secure reclosure. (The implication is that a satisfactory reclosure must give the impression of being *tight* and a mere dust cap is not adequate.)

Relating the above requirements to various can closures under consideration, it will be realized that:

1—The Trutite does not actually meet the requirements of being "easy opening" and further does not fully give assurance of a tight reclosure.

2—The Conoseal largely fulfills the easy opening requirements and when a close fit between the end

cover is provided would seem to fulfill the tight reclosure attribute.

3—A screw cap reclosure that did not require a strong opening torque would meet the first requirement and the reclosure would automatically be adequate.

4—Many of the possibilities of friction covers on crowns would not provide a suitable reclosure either because of damage during opening or the difficulty [fol. 1087] in forcing the crown back by hand. The side seal cap type of reclosure as used on jars would of course have to be considered largely satisfactory from the standpoint of opening and reclosing.

The importance of heating the product in containers is partly emphasized by the fact that in 1945, 25% of the jar users interviewed stated that heating was done by placing unopened glass jars in hot water while only 6% of the can users heated in unopened cans. If this is a really important factor in providing a can to compete with jars on as many scores as possible, it would seem that an opening feature requiring the least amount of handling would be imperative. Of those types of closures already mentioned it is suggested that they would be preferred in the following order from best to poorest:

1) Pry off lid
2) Conoseal
3) Screw cap
4) Open top

In the foregoing attempts to relate certain of the features which are known to be requirements for an improved baby food can with some of the structures under consideration for development it should be made clear that these are only the opinion of the writer. In some cases, opinions may differ and in others a determination of actual consumer acceptance would be necessary to establish the true value of some of the factors. However, it seems apparent that if we knew today that all of the structures were equally satisfactory with respect to leakage the order of preference from a consumer acceptability and cost standpoint would be as follows:

First Choice— *Screw Cap Type*

Relatively easy opening, no cutting hazard, good reclosure, no raw edges, full opening, smooth body wall. Esti-
[fol. 1088] mated cost $1.00 more than open top.

Second Choice— *Pry Off Lid Type*

Relatively easy opening, no cutting hazard, good reclosure, no raw edges, full opening, beaded body wall. Estimated cost $1.00 more than open top.

Third Choice— *Conoseal Type*

Relatively easy opening, possible cutting hazard, fair reclosure, no remaining raw edges, full opening, smooth body wall. Estimated cost $2.15 more than open top.

Fourth Choice— *Trutite Type*

Difficult opening, fair reclosure, some cutting hazard, raw edges after opening, full opening, folded body wall. Estimated cost $2.75 more than open top.

Baby Food Survey

The Market Analysis Department conducted a test survey in May to determine consumer preference as regards baby food in tin versus glass. A total of 1,392 mothers of babies were surveyed, 1,341 of whom buy baby food.

The survey was divided into two parts: (1) New York City and (2) sixteen representative cities located in all parts of the country. 783 mothers were surveyed in New York and 609 in the sixteen cities. The charts following show the survey results in graphic form.

New York City

Consumer preference is strongly in favor of glass in New York City with 97% of the mothers preferring glass at the same price as tin, and with 89% still preferring glass even if they could get their regular brand at a lower price in tin. Very little baby food in tin is apparently offered in retail stores in New York currently; 97% of the mothers say their regular brand comes in glass and 3% say their brand comes in tin.

The chief reasons given by New York mothers for preferring baby food in glass are: more convenient; can keep leftovers in glass jar; can see contents of glass jar; and more sanitary. "More convenient" includes several specific reasons: easier to open; can heat in jar; have to transfer to jar anyway; and feed from jar. Beechnut is the outstanding brand, bought by 45% of those surveyed.

Sixteen Cities

In contrast with New York, the mothers surveyed in the sixteen cities have not had as much experience with glass. In fact, 66% of these mothers say their regular brand comes in tin, and 34% say it comes in glass. In the Central Division 80% of mothers surveyed say their regular brand comes in tin.

However, it seems likely that there will be a trend to glass when baby food is more available in glass than at present, judging from the following figures:

74% of the mothers would choose glass if they could buy their regular brand in either glass or tin at the same price. This contrasts with only 34% now buying their baby food in glass.

[fol. 1090] Furthermore, 52% would still choose glass

even if they could buy their regular brand in tin at a lower price.

Price may be a more important factor than in New York City because 74% would choose glass at the same price as tin, but only 52% would buy in glass if they could get their regular brand at a lower price in tin.

The same reasons for preferring glass are cited by these mothers as by New York mothers. However, it may be interesting to note that "more convenient" and "glass breaks" are the chief reasons given by the 26% minority who would choose tin if their regular brand came in either tin or glass, at the same price. Gerber is the leading baby food brand, used by 33% of the mothers surveyed in the 16 cities.

Please bear in mind that this survey is not broad enough to be taken as final or conclusive. Nevertheless, it is believed to be valid in suggesting the main points of the large picture as regards current consumer attitude toward tin vs. glass.

We hope that the nine charts will show you the survey's findings in a clearer way than would a mass of figures. If any questions occur to you on any of the points covered, please don't hesitate to let me know and I will reply by return mail.

Sincerely, S. T. Frame, Manager of Market Analysis.

[fol. 1091] GOVERNMENT'S EXHIBIT 419B

Baby Food Survey

The baby food survey was conducted in two parts: New York City and 16 representative cities. 1392 mothers of babies at the baby food eating age were included, of whom 1341 buy baby food.

New York City

783 mothers were surveyed in New York City, 751 of whom buy baby food.

560 mothers were surveyed by mail questionnaire, and 223 were surveyed by personal interview.

Survey includes principal racial and income groups. The attitude toward baby food was found to be the same among the different racial and income groups.

16 Cities
(excluding New York)

609 mothers were surveyed in the sixteen cities listed below. 590 of these mothers buy baby food.

548 mothers were surveyed by mail questionnaire, and 61 were surveyed by personal interview.

The sixteen cities are:

Springfield, Mass., Wilmington, Del., Charlotte, N. C., Jacksonville, Fla., Columbus, Ohio, Indianapolis, New Orleans, La., Kansas City, Mo., Tulsa, Okla., Minneapolis, Des Moines, Salt Lake City, Corpus Christi, WKN 9/8.
St. Louis, Mo., San Francisco, Seattle, Wash.

Market Analysis Department,
June, 1945.

Internal Correspondence

To: Location #43—Head Office
Attention: Mr. W. K. Neuman
From Location: #43—Head Office
Date: August 13, 1953
Refer To: Request for Product Development Project
Subject: Tomato Catsup Can

R. Larson:

I've sat on this too long already—what do you think?

In reviewing food products packed in containers other than metal cans, it has occurred to us that tomato catsup, now packed exclusively in glass in retail sizes, presents a potential market for us. The results of a preliminary study of this problem are outlined below.

Previous Studies: The idea of catsup in cans is not new. In 1938, 1946, and again in 1949, the possibilities were investigated, giving consideration to various can-making materials and techniques then available. In each instance, the project was abandoned because of the corrosive properties of the product, and its tendency to change color when exposed to air.

The most thorough investigation, that of 1949, included a small test pack of catsup in a 12 ounce cap-sealed cone top can. Several plate and enamel combinations were tested.

Storage life and usage tests were made. After 15 months at room temperature (and 11 months at 98°F) pressure developed within the most promising cans. Results of a 22 day usage test were similarly sub-standard.

A major limiting factor appears to have been the difficulty in fabricating an enamelled cone top with low metal exposure.

No controls of bottled catsup were reported as being included in the tests.

Preliminary Market Analysis: The bulk of the tomato catsup packed in the United States goes into retail-sized

bottles with a capacity of 12 fluid ounces (net weight of product 14 oz.). Average annual pack of such containers for 1951, 1952, and 1953 was:

Tomato Catsup	377,000,000 bottles
Chile Sauce	23,000,000 bottles
Total annually	400,000,000 bottles

Assuming that 50% of this potential could be switched to metal, and that Continental's participation was 50% of the metal business, we would then enjoy a volume of:

100,000,000 cans @ $30.50/M $3,050,000

Glass Container: Specifications of a typical glass container, made by Owens-Illinois, are outlined below:

[fol. 1102]

Height overall	8⅛4
Diameter	2⅛6
Volume, fl. oz.	12.5
Shelf space required, cu. in.	19.6
Tare weight, ounces	9.6
Gross weight, filled, ounces	23.6
Material	Clear white glass
Brand identification	Label
Closure	White "vapor-vacuum" cap
Cost per M (delivered without caps)	
Bulk	$26.10
Add for reshippers	8.90
Cost of closure, per M	6.00

No figures are available on spoilage through breakage, but it can be safely assumed that, with a hot-fill product, such losses will require consideration.

Can-Making Materials

At present, 603x700 open-top cans are used for institutional packs of catsup. Choice of Container manual specifies;

Body: 1.25# HDTP—I.S.E.
Ends: 1.25# HDTP—I.S.E. or #25 Electrotin.—I.S.E.

The repeated opening and closing of a small container, in household use, requires a package which will protect the product and metal plate against oxidation and corrosion under more difficult circumstances. It may prove desirable to investigate such materials as aluminum cones, or plastic spouts, in addition to enamel and tin plate research.

Requirements For Can: In developing a metal package for catsup, the basic advantages of metal should be considered, particularly:

(1) Metal is lighter than glass
(2) Metal is more resistant to temperature and impact failure.
(3) Metal may be lithographed.
(4) Being non-transparent, the metal package remains attractive when partly empty.
(5) Metal containers usually require less space than glass bottles of equal volume.

In addition, the metal catsup package should conform to the following general specifications required by the method in which the product is packed and used:

[fol. 1103] (1) Can should hold 12 fluid ounces (14 oz. net weight) of product.
(2) Can should resist processing temperatures up to 190° F.
(3) Can should be hermetically sealed.
(4) Can should be reclosable.
(5) Can should be suitable for dispensing product.
(6) Can should be attractive enough to place on restaurant tables, etc.
(7) Can must show cost advantage (delivered to consumer).

Further specifications can be developed when a detailed study is made in connection with development of the new container.

12-Ounce Cone Top Beer Can: One possible package, the cap-sealed cone top beer can, has been previously considered for catsup. While other packages may prove more suitable for catsup, the cone top can at least merits consideration, and can be readily compared to a glass bottle.

Beer can specifications appearing to apply most closely to catsup would be:

Body: 1.25# HDTP, I.S.E.
(Outside lithography extra)

Bottom: 1.25# HDTP, I.S.E.
Standard or multibeaded contour.

Top: 1.25# HDTP, I.S.E.
Added shoulder to permit vacuum cap to be pried off with knife.

This can is thus similar to the beer can, but with a higher tin coating, no wax lining, and changed end contours. The height could also be reduced slightly, since the domed bottom is eliminated.

Such a can would compare with the glass bottle as follows:

Specification	Bottle	Can
Height overall	804	503
Diameter	206	211
Volume, fluid oz.	12.5	12.5
Shelf space required, cu. in.	19.6	14.0
Tare weight, ounces	9.6	2.9
Estimated Price per M (without caps)		
Bulk	$26.10	$30.50
Add for reshippers	$ 8.90*	$ 3.58**
Shipment to canner, estimated	(included)	$ 1.00
Cost of Closure, per M	$ 6.00	$ 6.00
Typical transportation, filled bottles (Baltimore to Chicago)	$12.14	$ 8.70
Typical total cost to consuming area (excluding product, etc.)	$53.14	$49.78

*—Includes separators and set-up.
**—No set-up charge; separators not required.

[fols. 1104-1131] For comparative purposes, we have assumed the same closure for can and bottle. However, a substantial saving would be realized by us if a screw cap at perhaps $3.00/M, proved satisfactory for our containers.

Conclusions

Assuming that a suitable 12 ounce can, such as the above, can be developed, its advantages would be:

(1) A lower total cost for container *delivered to consumer*. The typical saving of $3.36 shown comes entirely from the cost of shipping the *filled* container, and will vary depending on the distance from packer to market. West Coast canners would therefore be particularly susceptible to a can. In California, which packs 33% of U. S. total of Tomato Products, our participation is 28%, compared

to U. S. Average CCC participation of 37% (3 yr Average).

(2) Reduced space requirements. The bottle requires 40% more space, causing higher warehouse costs, retail shelf usage, and home storage capacity. No dollar value reflecting this advantage of the can is presently available.

(3) Reduced breakage in packing and distribution.

(4) Presumably, a more attractive package, through use of lithography (to be confirmed by consumer survey)

(5) A more stable container. The wider base and lower center of gravity make the can harder to tip over.

Recommendations: It is therefore recommended that the Package Development Department be asked to undertake the problem of designing a retail-sized metal container for tomato catsup.

Consideration should include, but not be limited to, a modification of the 12-ounce cap sealed beer can.

This office will be glad to assist Mr. Larson in this matter in any way that may be necessary.

L. C. Dudley, per S. B. Smart.

Packaging Guide for Pressure Dispensed Foods

Barbecue Sauce

Product No. II

Description: Barbecue sauce is a formulated liquid sauce used primarily to season meats as they are being roasted, broiled or grilled. Originally this was a vinegar-base product with added salt, pepper and other spices; but now it is available on the commercial market with a wide range of basic ingredients such as salad oil, tomato, pineapple pulp, or pimiento pulp. Its consistency may range from that of water to a thicker sauce similar to catsup. Because of this wide variance in ingredients and consistency, no single

packing procedure will be applicable to all barbecue sauces.

Suggested Packing Procedure:

1. After rinsing the cans, the product is filled into them at a temperature of 190 to 200°F. A fill of 7 to 10 fluid ounces is used for 12-ounce containers and 10 to 13 fluid ounces for 16-ounce containers dependent on the product ingredients and the spray characteristics desired. The prescribed fill is generally inversely proportional to the solubility of gas propellent employed.
2. The filled cans are closed immediately by crimping the valve in place and are then inverted to allow hot product to sterilize the headspace area of the can. Note: This procedure should provide sufficient sterilization for most barbecue sauce formulations. However this factor requires checking for each product encountered. There are other sterilization procedures under study.
3. Cans are cooled to 85°F in cold water bath or sprays.
4. Cooled product is gassed through valve with desired gas at required pressure. To obtain a liquid stream of product, nitrogen gas* charged at 75 to 95 psig pressure is suggested. To obtain a foamy stream or spray; nitrous oxide, carbon dioxide or a suitable mixture of these two gases is used at a pressure range of 85 to 100 psig. Shaking is employed while charging these latter gases to hasten solution and bring container to equilibrium pressure. The exact pressure employed depends on the product formulation and controls to a high degree the percent product delivery obtained.

* Use of Nitrogen covered in U.S. Patent #2,723,200.

Containers: As with all formulated products, shelflife studies must be conducted before a specific container recommendation can be offered. Suggested container variables that are expected to perform best with the product may be obtained from Metal R & D. Any available knowledge of product's composition would be helpful for this purpose.

Valves: Several of the existing valves could be used to dispense many barbecue sauces satisfactorily. Because the

dispensing characteristics are dependent to a great degree on the actuator design, many sauces will require a specially designed actuator button to produce desired dispensing characteristics. When this is required, a valve manufacturer should be consulted.

(For Customer Research Use Only)

[fol. 1133] Because of the pulpy nature and discrete spice particles found in most barbecue sauces, we believe the minimum valve orifice size should be .040", and there will be occasions when this size will require passing the product through .020" screen or homogenizing it. Two valves that have been most promising in our laboratory work with barbecue sauce are a Clayton foam type valve and a Precision dip tube type valve. There are undoubtedly others that will perform just as satisfactorily.

Dispensing Procedure:

The dispensing procedure employed for barbecue sauce will depend on the valve used and the dispensing characteristics desired. Where a soluble gas has been employed for obtaining foamy stream or spray dispensing, the can should be shaken prior to opening valve, and shaking is required after every 5 to 10 seconds of use. If an insoluble gas is used to give a non-aerated stream, no shaking is required prior to dispensing or during dispensing of product. Product delivery should range from 90 to 98% of contents by weight depending on product viscosity.

Remarks:

Many questions concerning a product such as this can only be resolved after knowing the properties of the specific product involved and the customer's requirements. Therefore, Metal R & D should be consulted whenever any questions arise concerning a specific customer's product.

Packaging Guide For Pressure Dispensed Foods

Chocolate Syrup

Product No. I

Description: Chocolate syrup, or more commonly, chocolate flavored syrup is a formulated free flowing sugar base product flavored with chocolate and/or cocoa, salt and vanillin. It consists essentially of 55 to 75% sugar and 25 to 40% water. It is used mainly as a sundae topping or as a flavoring agent for milk beverages.

Suggested Packing Procedure:

1. After rinsing the cans, the product is filled into them at a temperature of 190 to 200°F. A fill of 9 to 10 fluid ounces is suggested for 12 ounce containers and 12 to 13 fluid ounces for 16 ounce containers.
2. The cans are closed immediately by crimping the valve in place and are then inverted to allow hot product to sterilize the headspace area of the can.
   Note: This procedure should provide sufficient sterilization for most chocolate syrup formulations. However, this factor requires checking for each product encountered.
3. Cans are cooled to 85°F in cold water or by another suitable cooling method.
4. Cooled product is gassed through valve. Charging with Nitrogen gas at 75 to 95 psig pressure with no shaking is suggested to obtain a non-aerated stream and greatest product delivery.* The exact pressure employed is dependent on the viscosity of the product. More soluble gases such as Nitrous Oxide or Carbon Dioxide will produce an aerated product of lighter color.

* Use of Nitrogen for this purpose is covered in U.S. Patent #2,723,200.

Containers: As with all formulated products, shelflife studies must be conducted before a specific container recom-

mendation can be offered. Suggested container variables that are expected to give the best performance with the formulation may be obtained from Metal R & D. Any available knowledge of product's composition would be helpful for this purpose.

Valves: Several of the existing valves could be used to dispense chocolate syrup satisfactorily. We have experimented primarily with a Clayton foam type valve and a Precision dip tube type valve with a beverage actuator in the laboratory. There are undoubtedly others that will perform just as satisfactorily.

Dispensing Procedure: No shaking is required prior to dispensing the product. Cans with dip tube valves are dispensed in upright position. Those with foam type valves are dispensed in inverted position. Product delivery should range from 90 to 98% of contents by weight depending on product viscosity.

Remarks: This information will not be entirely applicable to all chocolate syrup formulations that will be encountered. Therefore, Metal R & D should be consulted whenever any questions arise concerning a specific customer's product.

[fol. 1135] GOVERNMENT'S EXHIBIT 425

Packaging Guide for Pressure Dispensed Foods

Salad Dressings

Product No. III

Description: Salad dressings are formulated liquid to semiliquid products that are used to savor vegetable or fruit salads. Their formulations are varied and are generally considered as a trade secret by the manufacturer. Some

of the more common types are mayonnaise, French dressing and Russian dressing. All are highly acid and have a pH range of 3.0 to 4.5. Most salad dressings contain vegetable oils, water, salt and spices as their main ingredients. Analyses of several salad dressings showed water content to range from 10 to 70%, fat to range from 6 to 83%, and salt to range from 1.3 to 1.6%.

Mayonnaise is the only salad dressing included in the Food and Drug Administration Standards at this time. They describe the product as follows:

"The semisolid emulsion of edible vegetable oil, egg yolk, or whole egg, a vinegar, and/or lemon juice with one or more of the following: salt, flavoring, sugar, and/or dextrose. The finished product contains not less than 50% of edible vegetable oil."

Suggested Packing Procedure:

The packing procedure employed for salad dressings will vary depending on the specific product formulation and the dispensing characteristics desired. The following are suggested packing procedures for several of the variations in salad dressings that might be encountered:

1. The cans should be rinsed with a stream of warm, clean water prior to filling any salad dressing product into them.
2. The product should be filled at as high a temperature as practical to obtain maximum sterilizing advantage from the heat. With some dressings that are not adversely affected by heat, this can be at 190 to 200°F while other less stable products such as mayonnaise will require a filling temperature of 40 to 70°F.

   A fill of 7 to 10 fluid ounces is employed for 12-ounce containers and 10 to 13-fluid ounces for 16-ounce containers dependent on the formulation and the dispensing characteristics desired. In general, the prescribed fill is inversely proportional to the solubility of the gas propellant used.
3. The filled cans are closed immediately by crimping the valve in place and hot filled cans are then in-

verted to allow hot product to sterilize the headspace area of the can.* Vacuum crimping is preferred, particularly for cold filled products, to reduce the headspace oxygen in the container. The same objective might be accomplished by purging the filled cans with an inert gas prior to seating the valve cup.

*This procedure should provide sufficient sterilization for most salad dressing formulations. However, this factor requires checking for each product encountered. There are other sterilization procedures under study.

[fol. 1136] 4. Cans of hot filled products are cooled to 85°F in cold water baths or sprays.**

** Studies in progress at Metal R & D indicate that gas charging of hot products might be employed, if desired, particularly when propellants of low solubility are to be used. The hot product must be charged with the gas at an appreciably higher charging pressure to obtain an equivalent equilibrium pressure at 70°F. The charging pressure required with gases having high solubility for hot products may prove to be too high to be practical.

5. Cooled product is gassed through the valve with the required gas at required pressures. To obtain a liquid stream of product having minimum aeration, nitrogen gas*** charged at 75 to 95 psig pressure is suggested. To obtain a foamy stream or spray; more soluable gases such as nitrous oxide or carbon dioxide are used at a pressure range of 85 to 100 psig. Shaking is employed for 10 to 20 seconds while charging these latter gases to hasten solution and bring container to equilibrium pressure. The exact pressure employed depends primarily on the product formulation and controls to a high degree the percent product delivery and overrun obtained.

***Use of Nitrogen covered in U.S. Patent #2,723,200.

Containers:

As with all formulated products, shelflife studies with salad dressings must be conducted before a specific container recommendation can be offered. Suggested container variables that should be tested with the product may be obtained from Metal R & D. Knowledge of product's composition and chemical properties is necessary to Metal R & D in making this decision.

Valves:

Several of the existing valves could be used to dispense many salad dressings satisfactorily. Because the dispensing characteristics are dependent to a great degree on the actuator design, many dressings may require a specially designed actuator button to produce desired dispensing forms. When this is required, a valve manufacturer should be consulted.

Two valves that have been most promising in Metal R & D work with salad dressing are a Clayton foam type valve and a Precision dip tube type valve. There are undoubtedly others that will perform just as satisfactorily.

As a word of caution, most salad dressings are considered as highly corrosive products, particularly in the headspace area of the can. Therefore a well coated valve cup is required with a low metal exposure enameled dome to avoid perforations in this area.

[fol. 1137] Dispensing Procedure:

The dispensing procedure employed for salad dressings will depend on the valve used and the dispensing characteristics desired. Where a soluble gas has been employed for obtaining foamy stream or spray dispensing, the can should be shaken prior to opening valve, and shaking is required after every 5 to 10 seconds of use. If an insoluble gas is used to give a non-aerated stream, no shaking is required prior to dispensing or during dispensing of product. Product delivery should range from 90 to 98% of contents by weight depending on product viscosity. If the product is intended to be refrigerated prior to consumer use, the effect of the lower temperature on can pressure and result-

ing dispensing characteristics must be considered when developing the packing specifications.

Remarks:

Many questions concerning a product such as this can only be resolved after knowing the properties of the specific product involved and the customer's requirements. Whenever Metal R & D is consulted concerning a specific customer's product, as much information as possible relating to the pressure dispensed product should be made available.

Packaging Guide for Pressure Dispensed Foods

Dressings for Salad

Product No. III

Description: Dressings for salad are formulated liquid to semisolid products that are used to savor vegetable or fruit salads. Their formulations are varied and are generally considered as a trade secret by the manufacturer. Some of the more common types are mayonnaise, French dressing and Russian dressing. All are highly acid and have a pH range of 3.0 to 4.5. Most dressings contain vegetable oils, vinegar, salt and spices as their main ingredients. Three types of dressing: mayonnaise, French dressing, and salad dressing are included in Food and Drug Administration Standards at this time. Their general definitions are given at the end of this write-up. Dressings included in these definitions must contain 30 to 65% by weight vegetable oil depending on the dressing. For any dressings that are to be moved in Interstate Commerce and do not fall under the

three defined products, it is suggested the Food and Drug Administration be consulted concerning labeling requirements.

Suggested Packing Procedure:

The packing procedure employed for salad dressings will vary depending on the specific product formulation and the dispensing characteristics desired. The following are suggested packing procedures for several of the variations in salad dressings that might be encountered:

1. The cans should be rinsed with a stream of warm, clean water prior to filling any salad dressing product into them.

2. The product should be filled at as high a temperature as practical to obtain maximum sterilizing advantage from the heat. With some dressings that are not adversely affected by heat, this can be at 190° to 200°F. while other less stable products such as mayonnaise will require a filling temperature of 40° to 70°F. The latter cold-filled products usually must be marketed and consumed under refrigerated storage conditions.

   A fill of 7 to 10 fluid ounces is employed for 12-ounce containers and 10 to 13 fluid ounces for 16-ounce containers dependent on the formulation and the dispensing characteristics desired. In general, the prescribed fill is inversely proportional to the solubility of the gas propellant used.

3. The filled cans are closed immediately by crimping the valve in place and hot filled cans are then inverted to allow hot product to sterilize the headspace area of the can.* Vacuum crimping is preferred, particularly for cold filled products, to reduce the headspace oxygen in the container. The same objective might be accomplished by purging the filled cans with an inert gas prior to seating the valve cup.

* This procedure should provide sufficient sterilization for most salad dressing formulations. However, this factor requires checking for each product encountered. There are other sterilization procedures under study.

[fol. 1139] 4. Cans of hot filled products are cooled to 85°F. in cold water baths or sprays.**

**Studies in progress at Metal R & D indicate that gas charging of hot products might be employed, if desired, particularly when propellants of low solubility are to be used. The hot product must be charged with the gas at an appreciably higher charging pressure to obtain an equivalent equilibrium pressure at 70°F. The charging pressure required with gases having high solubility for hot products may prove to be too high to be practical.

5. Cooled product is gassed through the valve with the required gas at required pressures. To obtain a liquid stream of product having minimum aeration, nitrogen gas*** charged at 75 to 95 psig pressure is suggested. To obtain a foamy stream or spray, more soluble gases such as nitrous oxide or carbon dioxide are used at a pressure range of 85 to 100 psig. Shaking is employed for 10 to 20 seconds while charging these latter gases to hasten solution and bring container to equilibrium pressure. The exact pressure employed depends primarily on the product formulation and controls to a high degree the percent product delivery and overrun obtained.

***Use of Nitrogen covered in U. S. Patent No. 2,723,200

Containers:

As with all formulated products, shelf-life studies with salad dressings must be conducted before a specific container recommendation can be offered. Suggested container variables that should be tested with the product may be obtained from Metal R & D. Knowledge of product's composition and chemical properties is necessary to Metal R & D in making this decision.

Valves:

Several of the existing valves could be used to dispense many salad dressings satisfactorily. Because the dispens-

ing characteristics are dependent to a great degree on the actuator design, many dressings may require a specially designed actuator button to produce desired dispensing forms. When this is required, a valve manufacturer should be consulted.

Two valves that have been most promising in Metal R & D work with salad dressing are a Clayton foam type valve and a Precision dip tube type valve. There are undoubtedly others that will perform just as satisfactorily.

As a word of caution, most salad dressings are considered as highly corrosive products, particularly in the headspace area of the can. Therefore, a well coated valve cup is required with a low metal exposure enameled dome to avoid perforations in this area.

[fol. 1140] Dispensing Procedure:

The dispensing procedure employed for salad dressings will depend on the valve used and the dispensing characteristics desired. Where a soluble gas has been employed for obtaining foamy stream or spray dispensing, the can should be shaken prior to opening valve, and shaking is required after every 5 to 10 seconds of use. If an insoluble gas is used to give a non-aerated stream, no shaking is required prior to dispensing or during dispensing of product. Product delivery should range from 90 to 98% of contents by weight depending on product viscosity. If the product is intended to be refrigerated prior to consumer use, the effect of the lower temperature on can pressure and resulting dispensing characteristics must be considered when developing the packing specifications.

Remarks:

Many questions concerning a product such as this can only be resolved after knowing the properties of the specific product involved and the customer's requirements. Whenever Metal R & D is consulted concerning a specific customer's product, as much information as possible relating to the pressure dispensed product should be made available.

Regulations:

Certain dressings for food moving in Interstate Commerce are regulated by a Standard of Identity and Label

Statement of Optimal Ingredients promulgated August 8, 1950 under the Federal Food, Drug, and Cosmetic Act. They are covered specifically as "Mayonnaise", "French Dressing", and "Salad Dressings".

In general, mayonnaise is defined as an emulsified semisolid food prepared from edible vegetable oil, acidifying ingredients of vinegars, lemon juice or lime juice, and certain egg-yolk-containing ingredients. It may be seasoned with salt, certain sweetening ingredients, spices other than turmeric or saffron, monosodium glutamate, or any suitable, harmless food seasoning or flavoring (other than imitations), provided it does not impart to the mayonnaise a color simulating the color imparted by egg yolk. Mayonnaise contains not less than 65 percent by weight of vegetable oil.

French dressing may be defined as a separable liquid food or an emulsified viscous fluid food prepared from edible vegetable oil and acidifying ingredients of vinegar, lemon juice or lime juice. It may be seasoned with salt, certain sweetening ingredients, spices, monosodium glutamate, any suitable harmless food seasoning or flavoring (other than imitations), tomato paste or puree, catsup, or sherry wine. It may be emulsified with any of several allowable emulsifying ingredients providing these ingredients do not exceed 0.75 percent by weight of the finished product. French dressing contains not less than 35 percent by weight of vegetable oil.

Salad dressing is the emulsified semisolid food prepared from edible vegetable oil, acidifying ingredients of vinegars, lemon juice or lime juice, certain egg-yolk-containing ingredients, and a cooked or partly cooked starchy paste prepared from food starch, wheat flour, rye flour, tapioca flour or any mixture of these. It may be seasoned or flavored with salt, certain sweetening agents, spices other than turmeric or saff-on, monosodium glutamate, or any suitable, harmless food seasoning or flavoring (other than imitations), provided it does not impart to the salad dressing a color simulating the color imparted by egg yolk. It may [fol. 1141] contain any of several allowable emulsifying ingredients, provided the quantity of these ingredients do not exceed 0.75 percent by weight of the finished product. Salad dressing contains not less than 30 percent by weight

of vegetable oil and no less egg-yolk-containing ingredient than is equivalent in egg-yolk solids content to 4 percent by weight of liquid egg yolks.

Packaging Guide For Pressure Dispensed Food

Whipped Toppings

Product No. IV

Description: Whipped toppings are frothy formulated food products used to top other foods, generally desserts, to make them more appetizing. The first pressurized food product was a whipped topping, whipped cream, which reached the market in 1948. Since that time, many different pressurized whipped creams have been marketed and more recently, several synthetic whipped creams where butterfat is partially or completely replaced with vegetable fats have become popular. The latter are classified as whipped toppings and can be obtained in several flavors. Other whipped topping possibilities are cake icings, marshmallow, and egg meringue.

A typical whipped cream type topping might consist of 25 to 30% fat, 5 to 10% sugar, 2 to 3% stabilizer (skim milk powder, gelatin, dry egg albumin or yolk, or sodium caseinate), 55 to 68% water and a flavoring agent such as vanilla.

Suggested Packing Procedure:

Since most whipped toppings can be considered somewhat similar with respect to their foamy dispensing characteristics, pH, heat stability properties and viscosity, packing and handling procedures employed for the majority of them are fairly well standardized. Most of them must be marketed and used under refrigerated storage

conditions, and have a shelf life of less than three months at 40°F. The following is the suggested packing procedure for the general line of whipped toppings.

1. The empty cans should be rinsed with a stream of warm, clean water prior to filling with product. The valves are generally dipped in a mild chlorine solution (2-3 ppm residual chlorine) prior to affixing to filled cans.
2. Products of this nature are usually filled cold at 40° to 60°F. under as sanitary conditions as possible or those regulated by law.
   A fill of 6 to 7 fluid ounces of liquid product is generally employed for 12-ounce (211 x 413) containers and 9 to 10 fluid ounces for 16-ounce (211 x 604) containers. The ratio of product volume to headspace volume is purposely lower for this type product to allow for a greater charge of gas which serves to dispense the product and also aerate it. Increasing this ratio by increasing the product fill results in lower overrun [1] of dispensed product and less product delivery for same initial equilibrium pressure.

[fol. 1143] 3. The filled cans are closed immediately by crimping the valve in place. Vacuum crimping is preferred for these cold-filled products to reduce the headspace oxygen in the container. The same objective might be accomplished by purging the headspace of the filled cans with an inert gas prior to seating the valve.

4. The sealed cans of product are gassed through the valve with the required gas at required pressures. The more soluble gases such as nitrous oxide, carbon dioxide or some mixture of these are employed to produce a whipped product. Charging pressures generally range from 90 to 130 psig. The cans are shaken violently for 10 to 30 seconds during product gassing to hasten absorption of gas in product. When the proper gassing and shaking cycle is employed, the cans will be within 3 to 5 pounds of

---

[1] Overrun is the percent volume increase between the dispensed product and the filled product.

equilibrium pressure after this operation. Equilibrium pressures range from 85 to 100 psig at 70°F.

5. Charged containers can be passed through a water bath to detect any leakers through evolution of bubbles. A mild cleansing agent might be desired in the water during this operation to clean spilled product from the outside of the containers. The water should be treated with chlorine (2-3 ppm residual chlorine) to keep the bacteria count minimized.

Containers:

As with all formulated products, shelf life studies with whipped toppings must be conducted before a specific container recommendation can be offered. Suggested container variables that should be tested with the product may be obtained from Metal R & D. Knowledge of product's composition and chemical properties is necessary to Metal R & D in making this decision.

Valves:

The most popular valve employed for whipped toppings is the foam type valve which has no dip tube and requires inversion of the container for dispensing. Because of its simpler construction and less material requirements, this style valve is less costly than the spray type valves. It is supplied by several valve manufacturers. Among these are: Clayton Pressure Products of St. Louis, Super Whip, Inc. of Chicago, Dairy Whipt, Inc. of Chicago, and Pressure Dispensers, Inc. of Hollywood, California.

There are spray type valves that may be used successfully with some whipped toppings and permit upright dispensing of product. These would cost more and our experience with them for this purpose is limited. They are available from such concerns as Precision Valve Corp. of Yonkers, N. Y. and Clayton Pressure Products of St. Louis.

Dispensing Procedure:

In order to assure the most effective dispensing of whipped toppings, the containers should be shaken prior to each use and after every 5 to 10 seconds of use. Also

with foam type valves which require container inversion for use, the container should be held a few seconds in the inverted position prior to operating valve to allow product [fol. 1144] to flow to the valve area. Following this procedure will minimize product splattering and result in greatest obtainable product delivery and overrun. For most whipped toppings, product delivery is expected to average 90% of filled contents and overrun should range from 175 to 225%.

Remarks:

Many questions concerning a product such as this can only be resolved after knowing the properties of the specific product involved and the customer's requirements. Whenever Metal R & D is consulted concerning a specific customer's product, as much information as possible relating to the pressure dispensed product should be made available.

[fol. 1145] GOVERNMENT'S EXHIBIT 429

Liquid Detergents

Analysis of the Potential Market for Metal Cans
Commercial Research Department

January 1954

[fol. 1146] Continental Can Company, Inc.

100 East 42nd Street
New York 17, N. Y.

January 19, 1954.

To: Mr. L. C. Mackelden

Subject: Liquid Detergents—Analysis of the Potential Market

The accompanying report summarizes the results of our investigation of the new liquid synthetic detergents as a potential market for metal cans, and Continental's prospects in this field. The findings and conclusions, which precede the main part of the report, are self-explanatory, but I would like to emphasize the following key points:

1. There is a real opportunity for Continental to enter a new and rapidly growing market. There is a definite trend toward the use of cans in place of the glass packages now used by most producers. The non-breakability feature is particularly important, to consumers, for liquid detergents and Continental should expedite its development work in order to enter this market, *as soon as possible.*
2. Although 12 ounces is not yet established as a standard size, it will apparently be a leading size and appears to be one best suited for metal cans. Total industry requirements for 1955 are estimated at about 130 million containers (12 ounce equivalent). A market for 260 million—with liquids at 10% of the total synthetics market—is within sight in a few years.

Because the experience on which to base growth projections is extremely limited, and because only a few companies could supply any helpful information, these estimates should be treated as very rough approximations. The only thing that is clear is that growth has been extremely rapid and is still continuing. We hope, as additional experience is gained during this year in the marketing of liquids, to be able to refine these estimates for you.

We trust this report will be helpful. Additional copies are available for further distribution if you wish them.

D. H. Walker.

[fol. 1148] Summary and Conclusions

Liquid Synthetics in Metal Cans

The packaging of liquid synthetic detergents is rapidly developing into an important new market for metal cans. Liquids, the most recently developed form of synthetic detergents, are the brand new answer to dishwashing problems. They are already established as one of the leading dishwashing products even though they've been on the market only four years and have been strongly promoted for only two. At present, most of these liquids are packaged in glass. But metal is also in the field and there appears to be a definite trend toward *increased use of cans* as opposed to glass. With expanding demand and growing acceptance of the metal container, Continental has the opportunity to enter a new area of packaging.

The Market

Percentagewise, the liquid product is the fastest growing portion of the synthetic detergent market. And so far there are no signs of a let-up. In 1949, liquids made up only .3% of all packaged synthetics sold. (See Table II, Section I.) By the end of 1953, they constituted a full 3% of total volume.

The basic reason for this tremendous increase is the growing consumer preference for synthetics—both solid and liquid—over soap. The figures are really impressive. In only five years, from 1948 to 1953, the synthetics' share of the 3.3 billion pound market for cleansers rose from 20% to 75%. What made consumers so readily accept this new product? First, the shortages of soap products during and immediately following World War II forced consumer to try substitutes. Then it was found that synthetics had many natural advantages over soap—quick and more thorough [fol. 1149] washing, faster suds formation, no dulling of washable materials and speedy rinsing. The move to synthetics was on! At all three levels of distribution—the manufacturer, the retailer and the consumer—synthetics proved, for most uses, to be superior to soap and more economical in terms of time and/or money.

The advantages of synthetics over soap apply equally

well to both solids and liquids. But liquids have even more to be said in their favor for light washing. They are generally milder, easier to pour and more readily soluble. They are not "dusty" and cannot abrase washable materials.

Existing Brands

There are five liquid brands currently competing for the housewives' favor. They are "Joy", "Lux", "Glim", "Chat", and "Rol". Of the five, only "Joy" a Procter and Gamble product, has complete national distribution, at present. Since its introduction on a countrywide scale in mid-1951, the name "Joy" has become almost synonymous with liquid detergent. Heavy promotions, millions of advertising dollars and concentrated merchandising and selling campaigns have paid off and "Joy" captured a hefty 80 to 85% of the liquid market.

After Procter and Gamble educated the public to the use of liquid synthetics via "Joy", Lever Brothers introduced liquid "Lux" in July of 1953. Consumer acceptance of this product exceeded Lever's most optimistic hopes. Their original sales forecast has recently been revised upward and they are thinking about expanding production facilities.

Despite competition from "Lux", sales of "Joy" have steadily increased. With both companies promoting their products with huge advertising budgets and concentrated merchandising campaigns, consumers are using *more liquids* rather than just switching from one liquid brand to another and total demand is growing rapidly.

[fol. 1150] The Future of Liquids

Based on the sales performance of the existing products, liquids are expected to take over more than 5% of the packaged synthetic detergent market by 1955, compared with 3% in 1953. The five products already on the market should do the job and if the manufacturers of these products decide to market more than one brand, or if new manufacturers enter the field, liquids could probably exceed 10% of the packaged synthetic market. It's hard to say when the 10% level will be reached but it should be within a few years.

Although 10% could not be called a lion's share of the total synthetic market, it still represents a very important

packaging market—approaching *260 million packages* annually.

The liquid variety is used almost exclusively for dishwashing and is heavily promoted by the manufacturers for that purpose. On the other hand, synthetics as a whole are used for both laundry and dishwashing. There is no breakdown available for the amount of synthetics used for dishwashing versus laundry but assuming the total was split 50-50, a 10% penetration of the *total* market by liquids, would mean a 20% penetration of the *dishwashing* market.

The Outlook for Cans

Before the introduction of "Lux", the package material for liquids was glass. But now, although the predominant package is still glass, it looks like there is a definite trend toward the metal container. "Lux" is being marketed in 12- and 22-ounce (capacity) cans developed by American. In addition, Procter and Gamble is willing to modify their formulation of "Joy" so that it could be put up in cans. The consumers prefer metal too. According to a recent consumer survey conducted by Lever Brothers, the metal can was definitely preferred over glass for this type of product.

[fol. 1151] If we can assume a complete changeover to metal cans by 1955, the industry would need the equivalent of *130 million 12-ounce containers* to package the *12.5 million gallons* of liquid expected to be sold. (The number of containers would be more if more containers were smaller than 12-ounce, but this size appears to be emerging as the standard size for a canned product.) When liquids capture 10% of the market, the can demand will top *260 million*. This represents *total* demand for liquid detergent cans.

To participate in this rapidly growing demand, Continental should expedite its development work on cans and can linings and enter this market *as soon as possible*. Table V (Section 1) illustrates the probable can demands on Continental at various degrees of participation in the market. At 25%, Continental would probably be called on to supply approximately 30-35 million 12-ounce cans, while at 50%, the demand would approach 70 million. At a reasonable 40% level—the level we now enjoy in beer, oil, meat, etc.—

we would be supplying more than 50 *million cans* by 1955—and probably close to 100 million within a few years.

It would also appear desirable that the Research Department investigate the possibilities of using a metal container similiar to the liquid detergent can for such glass-packed products as molasses, syrups, salad oil, floor and furniture polishes, cleansers, etc.

Commercial Research Department.

[fol. 1152] I. The Market for Liquid Synthetic Detergents

A. History of Synthetic Detergents

Development of synthetic detergents began in Germany during World War I, when shortages of fats and oils made soap substitutes necessary for industry.

The introduction of synthetic detergents in this country, in the late 1920's, met with wide industrial acceptance. Prior to World War I, industrial cleaning was done mostly with raw chemicals and with soap. The parts to be cleaned were either dipped into a bath or washed and scrubbed thoroughly. After the cleaning process the surfaces had to be absolutely free from dirt or foreign substances which might interfere with the application of subsequent finishes or with the further processing of the article. The careful and time-consuming rinsing action, necessary to free the cleansing agent from the product, materially reduced production speeds and indirectly increased costs. Thus, the requirements for a new synthetic industrial cleaning compound were: fast action, efficiency and ease in rinsing. Synthetic detergents have not only satisfied these requirements, but could also be "tailor made" to the job.

In the mid-1930's, synthetics for consumer use were marketed, but without great success. Procter and Gamble Company was a pioneer in this field with "Drene" shampoo and "Dreft" washing powders. Colgate-Palmolive Company followed shortly thereafter with "Halo" shampoo and "Vel" washing powder and both companies introduced liquid dentifrices using synthetic detergents as the cleansing agent (i.e., "Teel"). "Spic and Span", a non-sudsing syn-

thetic for use on walls and floors was brought out by Procter and Gamble shortly before World War II.

Shortages of household soap products in the War and post-War period immediately increased consumer interest in synthetic detergents. In late 1947, synthetics for consumer use emerged as a definite competitor to soap.

[fol. 1153] B. The Detergent Market—Synthetics vs. Soap

The revolution of the detergent industry, from soap to synthetics, is shown in Table I and graphically in Chart I. In 1948, synthetics had only 12% of all detergent sales (400 million pounds out of 3.4 billion); but by 1952, four years later, it had captured 47% of the 3.3 billion pound market. As of the middle of 1953, synthetics had surpassed soap, accounting for about 55% of total detergent sales.

Even overshadowing the rapid rise of synthetics has been the spectacular growth (percentagewise) of the liquid portion. Sales were a trifling $7,900 in 1948; by 1952 they were over $22 million (from 89,000 gallons to 6.2 million gallons). In the first 6 months of this year, dollar sales reached $19.7 million (5.1 million gallons). A reasonable estimate for the full year should be $45-50 million (12.5 million gallons).

C. The Packaged Market

The packaged market is the household (consumer) portion of detergent sales. As shown in Chart II, synthetics in this market are estimated to outsell packaged soaps by about 3:1, capturing an estimated 75% of total sales by the end of 1953. Five years earlier, in 1948, packaged synthetics ran a poor second having a penetration of only 20% (Table II A).

As for liquids, about half of all sales reach the consumer, the other half going to industry. In its first year of introduction to the housewife, 1949, liquid synthetic sales amounted to one-quarter of a million gallons (2 million pounds), only three-tenths of one percent of all consumer synthetic detergent purchases. By 1952, the liquid portion rose to 1.7%, 3.1 million gallons (25 million pounds), more than an 11-fold increase. Sales in the first half of 1953 show liquids at a 2.4% penetration, having a sales volume of 2.5 million gallons (20 million pounds).

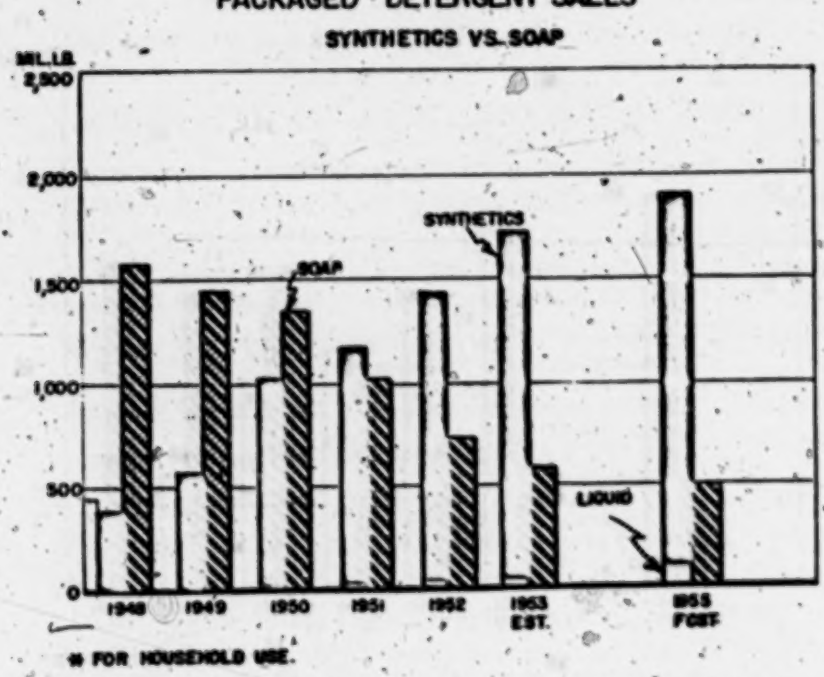
1953 (Est.)	1730	75	570	25	2300

*—Packaged Sales denotes household use.

CHART II



[fol. 1156] In other words, retail sales of liquid synthetics in the first 6 months of this year equalled 80% of the total liquid synthetic retail sales in all of 1952. This performance does not include any sales activity of "Lux" since the Lever Brothers' product did not start national distribution until July.

These figures are reported by the Sales Census of the Association of American Soap and Glycerine Producers Inc. (a trade organization whose membership exceeds 80% of the entire industry) and are shown in Table II B.

Table II B

Breakdown of Packaged Synthetic Detergent Sales

	Liquid Synthetics* (MM #)	% of Total	Solid Synthetics (MM #)	% of Total	Total Sales of Synthetic Detergents (MM #)
1948	—	—	380	100.0	380
1949	2	.3	668	99.7	670
1950	10	1.0	1020	99.0	1030

1953 (Est.)	50	2.9	1680	97.1	1730

*—Liquids converted to pounds on a basis of 8 pounds (16 fluid ounces per pound) to the gallon.

[fol. 1157] D. Brand Competition—Liquid Synthetics

Currently competing for the consumer's favor are five liquids whose product specifications are shown below:

Brand Name	Manufacturing Co. (Filling Loc.)	Class and Formula	% Concentrated	Type
"Joy"	Procter & Gamble (Cincinnati)	Not disclosed	Not disclosed	Not disclosed
"Glim"	B. T. Babbitt (not disclosed)	Ethylene oxide condensation of an alkyl phenol	83%	Nonionic
"Rol"	Fels & Company (not disclosed)	Not disclosed	Not disclosed	Anionic
"Lux"	Lever Brothers (contract fillers)	Not disclosed	Not disclosed	Anionic
"Chat"	Antara Chemicals Div. General Aniline (not disclosed)	Compounded for mechanical dishwashing	Not disclosed	Anionic

The lion's share of this market is held by "Joy", 80-85%, while "Glim" held second place prior to the introduction of Lever's "Lux". Both Lever and Fels seem to be pretesting their products market by market.

"Lux" is apparently making great strides. According to recent information, the original sales goal, approximating 18 million 12-ounce cans and 6 million 22-ounce cans, in the first 12 months after introduction, is being greatly exceeded.

Available information suggests a 60:40 sales ratio favoring the 12-ounce versus the 22-ounce can. While it is yet too early to determine national consumer acceptance of the "Lux" product, the company (Lever Brothers) is filling the national pipeline and has plans under consideration for expanding capacity to meet expected demand.

At present, their product is being manufactured and packed in the East by Fluid Chemical Co. (Newark, N.J.) and in the Midwest by Stepan Chemical Co. (Chicago). The reason for employing outside manufacturers and packagers is the lack of producing and filling equipment by Lever Brothers.

[fol. 1158] The only canned product on the market "Lux" sells 12 fluid ounces for 39¢. The price is claimed to allow dealers a large mark-up, yet still enable them to sell at prices lower than competitors ("Joy" is 7 ounces for 29¢; "Glim," 6 ounces for 27¢).

Colgate-Palmolive, not an entrant as yet, is sitting back and watching. They admit having a product in readiness, one which can compete with "Joy" and "Lux", but they are awaiting the results of the "Joy-Lux" battle. If the results indicate an over-all increase in the use of liquids rather than a competitive realignment, Colgate and other manufacturers will probably enter the liquid market. Apparently, they are following the line of least resistance, letting Procter and Gamble and Lever educate the public to the use of liquid synthetics for dishwashing.

E. Prospects for Growth of Liquid Synthetics

The outlook for liquid synthetics is especially bright. Most of the companies have high hopes but because of the newness of the liquid product (it has been out since 1949, but only heavily promoted since mid-1951), they are treading cautiously.

One fact is certain. The consumer has taken to liquid synthetics, at least for the dishes. A recent Consumer Analysis (1953) of 17 markets across the country, presents the consumer preference picture for the use of cleansing agents for dishwashing. The results of this survey are shown in Table III following:

[fol. 1159] **Table III**

Consumer Brand Preference for the Five Ranking Dishwashing Product Brands
(Rank)

Market	(1) Tide	(2) Joy	(3) Dreft	(4) Vel	(5) Ivory Bar
Portland, Me.	3	5	11	—	1
Washington, D.C.	1	2	5	6	3
Columbus, O.	1	2	4	8	6
Cincinnati, O.	1	2	3	6	15
Indianapolis, Ind.	1	3	2	5	—
Milwaukee, Wisc.	2	1	4	3	10
St. Paul, Minn.	2	3	1	5	7
Duluth-Superior, Minn.	1	4	8	6	3
Omaha, Neb.	2	1	4	3	—
Salt Lake City, Utah	1	3	4	2	11
Seattle, Wash.	3	4	7	9	1
Long Beach, Calif.	1	2	4	3	9
Sacramento, Calif.	1	2	4	3	5
Fresno, Calif.	1	4	3	2	10
Modesto, Calif.	1	3	4	2	6
San Jose, Calif.	1	3	4	2	—
Honolulu, Hawaii	1	3	9	8	2

The table is interesting in many respects. Notice that of the five leading products used for dishwashing, the first four are synthetic detergents. Also interesting is the fact that "Joy", the newest product of the five (national distribution started in mid-1951), has reached second place in consumer preferences. It almost certainly indicates that the consumer is educated to the use of liquids, and now that another national brand has hit the market, increased usage will probably result.

One industry official has estimated that liquids could ultimately reach as high as 6% of the packaged synthetics market (liquids now have 2.4% of all poundage sold), but that was prior to any evaluation of the national introduction of "Lux" liquid by Lever Brothers. Taking into account the acceptance of "Lux" and the extent of promotion and expansion programs scheduled for the product, this figure could easily exceed 5% by 1955 and continue to 10% with the entrance of new products and likely conversion of some present solid form synthetics to a liquid state.

[fol. 1160] This share of the market indicates a volume level of about 100 million pounds (12.5 million gallons computed at the rate of 128 fluid ounces to the gallon) in 1955, as shown in Table IV and Chart III. *When the 10% level*

is reached, the volume should approximate 200 million pounds (25 million gallons).

Table V indicates the can requirements necessary to package these forecasted liquid production figures, together with Continental's requirements at various levels of participation in the market.

Originally, three factors were believed to be limiting influences to the growth of liquid synthetics. They were:

(1) the limited use for liquids; i.e., for dishes and fine fabrics,

(2) the original sales appeal of liquids for use in hard-water areas,

(3) the extent to which the manufacturers would be willing to promote the liquid so soon after the consumer's acceptance of powdered synthetics.

Point by point, in light of the recent developments in the liquid field, the importance of these factors was found to have been greatly overstated. Undouhtedly, the manufacturing companies would not have invested further in expensive manufacturing facilities and promotions if they felt that the liquid market was not a profitable one, or one of short-lived growth. Although "Joy" is estimated to have 80-85% of the market, "Lux" and "Rol" have become growing competitors, and Colgate has a product ready for introduction.

Because of its water-softening properties, liquids originally met with great success in the hard-water areas. Recent reports, however, indicate that the soft-water areas have also accepted liquids, a fact confirmed by data based on monthly grocery inventory surveys conducted by 12 newspapers in Boston, Winston-Salem, Cincinnati and Indianapolis. The sales in soft-water areas have been quite notable, suggesting that detergents sell equally well in both soft- and hard-water areas, given equal merchandising attention.

[fol. 1161]

Derivation of the Packaged Liquid Synthetic Detergent Demand

	Population (Excluding Armed Forces Overseas)	Per Capita Packaged Detergent* Consumption	Packaged Detergent Market	Synthetic Detergent Portion	Total Synthetic Market	Liquid Share	Liquids as % of Tot.

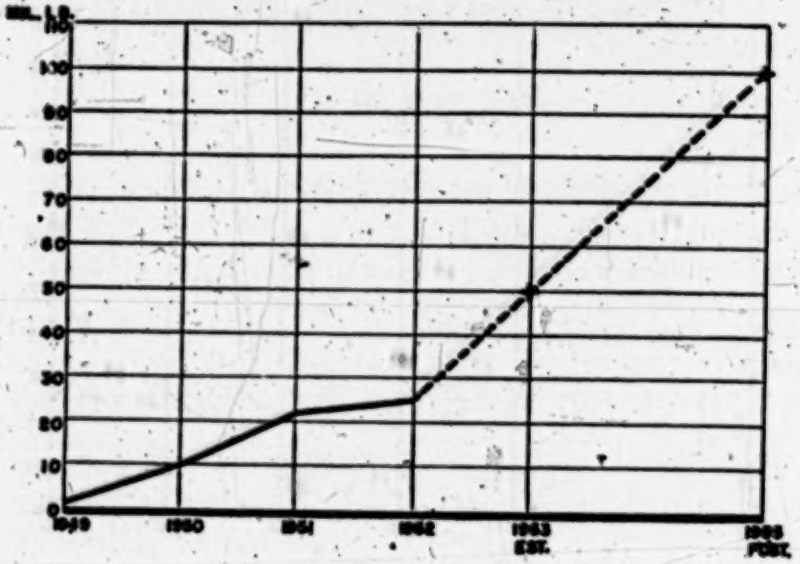
CHART III

PACKAGED LIQUID SYNTHETIC DETERGENT SALES



[fol. 1162]

Table V

Can Requirements for Liquid Synthetic Detergents

	Liquids as % of Packaged Syndet Market	Total Number of Gallons* (millions)	Equivalent Number of 12 oz. Cans (millions)	Continental Requirements at Percent Participation 25%	40% (millions)	50%
1953	3	6.5	69	17	28	35
1955	5	12.5	133	33	53	67
?	10	25.0	267	67	107	134

* Liquids converted to gallons on a basis of 8 pounds (128 fl. ounces) to the gallon.

[fol. 1163] Liquids are being pushed by heavy advertising campaigns. Procter and Gamble spent almost $2 million on "Joy" in 1952, securing 80-85% of the *$17 million packaged liquid market*, or about 14¢ per sales dollar. In the first 5 months of this year, the expenditure has exceeded $1.3 million. Lever Brothers, attempting to capture 25% of this market, has appropriated over $1 million for this year. "Glim", the B. T. Babbitt product, has increased its expenditure from $70,000 in 1952 to $93,000 in the first 5 months of 1953. Thus, it appears that in addition to a fierce com-

petitive battle developing, leading manufacturers such as Procter and Gamble and Lever are quite willing to promote this new entry, liquid synthetics, and to develop this market in direct competition with their established brands of powdered detergents.

[fol. 1164] II. The Metal Package

A. Technical Specifications of the Can

Until "Lux" was introduced in a metal can liquid synthetics were marketed in glass containers because at liquid's inception no satisfactory can lining had been found which would resist the chemically-active liquid synthetic detergents. Extensive and elaborate tests were conducted to determine the best packaging material and glass won out, probably by default.

With its metal-packed detergent, Lever can radically alter liquid detergent selling. The units containing the fluid, when submitted to our Research Department last July, were found to have the following specifications:

Can size: 211 x 508 over the double seams
Capacity: 15-16 fluid ounces
Blackplate can with cemented side seam
Base Coat (Body & Bottom)—Phenolic
Top Coat (Body & Bottom)—Vinyl
Can size: 316 x 650 over the double seams
Capacity: 1 pint 6 fluid ounces
Blackplate can with cemented side seam
Base Coat (Body & Bottom)—Phenolic
Top Coat (Body & Bottom)—Vinyl

The cans have a dripless metal spout crimped to a slightly domed top.

Despite the fact that the can had been developed through the joint efforts of American Can and Lever Brothers, neither company is entirely satisfied with it, and both companies are working on improvements. Reportedly Lever accepted the can only to facilitate getting their product on the market.

[fol. 1165] B. Glass versus Metal

Of the two materials, glass and metal, the can appears to offer numerous advantages. For the manufacturer, the all-around lithography results in a brilliantly colored display package while the can itself acts as the primary package. The glass container, on the other hand, is further packaged in a cardboard folding carton for additional protection. Non-breakability of the can reduces loss and waste at the filling machines, and while in transit. In the stores, it can be stocked compactly and securely, offering a colorful counter or shelf display. The retailer derives additional benefit through elimination of loss due to breakage.

Non-breakability is a vital consideration for the housewife who must frequently handle the package with wet, slippery hands. The dripless spout prevents the liquid from dripping down the sides of the can when being poured, eliminating, in some measure, one of the causes of slipperiness. Also, of course, the can will not become wet and buckle, as do cardboard packaged flakes and powders, and it occupies relatively little shelf space.

The disadvantages of the can are apparent, but are generally not of critical importance compared with the breakability problem with glass. When wet, the can is almost as slippery as the glass container; the liquid product is not immediately visible; the base of the can is prone to rust when in contact with wet surfaces (aluminum or aluminum coated bottoms should eliminate the rust ring); and prolonged shelf life will probably result in corrosion particles through interreaction of the detergent and metal.

C. Prospects for the Metal Can

At this time, the outlook for metal packed liquid synthetic detergents appears to be promising. As stated earlier, glass became the first container material because can linings were found to be unsatisfactory. Research has solved this problem, however, and a canned product is now already on the market.

[fol. 1166] Lever Brothers has conducted a consumer survey designed to measure the consumer preferences of container materials for their liquid product. The results indicated *a significant preference for metal.* Couple this with

the report that Procter and Gamble is willing to modify the formulation of "Joy" so as to be a more compatible product and it becomes conceivable (and probable) that virtually all liquid synthetics will be packed in metal cans. The fact that Colgate (who now is taking the "wait-and-see" attitude) had been discussing their product with several can companies gives added impetus to the trend toward metal cans.

The market for synth ic detergents, both solid and liquid, has been captured by the large soap companies because they already possessed the marketing machinery and promotional know-how for the distribution of such products and because synthetics would have eventually forced these soap companies to relinquish the major portion of their sales—soap for household use—to this new product. Historically, these three companies, Procter and Gamble, Lever and Colgate, have captured over 90% of the sales of household synthetic detergents. Because of this dominance the merchandising plans of the rest of the industry would follow the "Big Three".

D. Competition

American Can is out in front as the supplier of liquid detergent cans. Their can is being used by Lever Brothers. But the fact that they already have a can on the market does not necessarily make them the established leaders in the field. Each liquid brand, with separate and specific formulations requires special enamels and poses numerous problems. In a sense, every new manufacturer requires the redesigning, retesting and redeveloping of a liquid detergent [fol. 1167] can. For this reason, among others, no one can company could hold the entire market. The opportunities are excellent for Continental despite the initiative that American Can has gained, but no time should be lost in making a strong bid for a share of this rapidly developing market.

[fol. 1168] III. Technical Notes on the Nature of Liquid Synthetic Detergents

A detergent is any chemical material which has cleansing properties—the oldest being soap, the newest, synthetics! Synthetic detergents have been defined by the U. S. Bureau

of Standards as non-soap cleansing agents produced by organic synthesis. They take the usual forms of soap—bar, granule, flake, powder and liquid.

Although the number of synthetic detergents is legion, retail sales of household detergents are restricted almost 100% to two basic types, the alkyl aryl sodium sulfonates and the alcohol, or alkyl, sulfates.

Alkyl aryl sodium sulfonate is derived from either coal tar or petroleum sources, with benzene being the most important raw material from an economic viewpoint. The manufacture involves three steps:

(1) the chlorination of a kersene fraction;
(2) the condensation of alkyl chloride with benzene or toluene, and
(3) the sulfonation of the alkyl aryl compound. (The third step may be carried out either by the manufacturer of the alkyl aryl or by the soap companies that complete and distribute the product.) At the final step, alkyl aryl sulfonate is mixed with builders to give the degree of detergency desired.

Alcohol sulfate (technical nomenclature, "alkyl sulfate") is a sulfated derivation of a fatty alcohol. Its manufacture depends on:

(1) High pressure hydrogenation of fatty acids (stearic, oleic, palmitic and lauric) to form fatty alcohols, with chromium oxide or copper oxide acting as the catalyst; or
(2) Sodium reduction.

The alcohol is sulfated by either a batch or continuous process. The finished product for retail distribution is usually manufactured as a 30-35% active base, with sodium sulfate added as a builder, or as a 20% active base with sodium sulfate and sodium tripolyphosphate plus other materials as builders.

[fol. 1169] Synthetic detergents constitute three classes depending on whether the active ingredient is electrically charged positively, negatively, or is neutral. The three classes are technically designated as cationic, anionic and nonionic, respectively. The anionics, constitute by far the

largest volume. They contain practically all the important retail products and the major portion of the industrial products.

Because synthetics have special built-in properties and are made of different ingredients and by different processes, they do not have the natural drawbacks of soap. Syndets (synthetic detergents) have one property that make them highly desirable for use with hard water. Their calcium and magnesium salts are soluble, therefore, their use will not form scum or curds, leaving a grease ring around the dishpan, nor will any dulling films adhere to the material being washed. Synthetics also have the greater quality of reducing surface tension, thus allowing water to penetrate fabrics more quickly and thoroughly. They disperse and suspend dirt particles, and emulsify oil and grease, thus requiring less rinsing.

They are individually formulated to clean textiles, metals, and many other industrial materials; other "specially tailored" syndets are available for home use solely in washing machines or as wall and floor cleansers.

To the housewife, synthetics have three advantages over soap; time-saving in washing and rinsing, no soap film means no dulling of washable colors; and the sudsing action is built into the synthetic, the rate of which is dependent upon the desires of the manufacturer and the consumer.

The above qualities and advantages apply equally well to both solid and liquid synthetics; but liquids have certain advantages over the solids:

[fol. 1170] (1) there are no granules which can tear or injure the fabric,

(2) they do not contain strong alkalies, hence are milder and more readily applicable to fine laundering,

(3) they are more readily soluble,

(4) they are not "dusty", and

(5) they are easy to use.

But all is not milk and honey with synthetic detergents. Most synthetics have a much stronger defatting effect than does soap. These synthetics deplete the natural oils of the skin, causing in some some instances, "dishpan hands". They also extract the lubricating oils from washing machine bearings which come in contact with them.

These disadvantages in one way may, of course, become advantages in other ways. To some extent, correction of disadvantages lies in selecting the appropriate type of detergent for each use. To date, the advantages of synthetic detergents outweight the disadvantages, enough to increase the market for synthetics at a rapid rate, whereas the soap market has been steadily declining.

From the manufacturer's point of view, the relative stability of raw material prices gives added impetus to the promotion of synthetics. Tallow, the basic raw material for soap, has fluctuated between 5 and 18 cents per pound for the past few years. In the meantime, sodium alkyl aryl sulfonate, the principal raw material for synthetics, has been consistently between 13 and 15 cents per pound. Such price stability is a real advantage, and one that is in addition to the natural chemical edge which synthetics have over soap.

[fol. 1171] GOVERNMENT'S EXHIBIT 434

June 4, 1947

Comparative Costs

Single Trip Versus Returnable Beer Containers
Year 1943

Reprinted From "American Brewer"

The "American Brewer" magazine recently completed a series of articles which compared packaging and delivery costs between various types of beer containers. The articles were based on a report dated June 20, 1944 prepared by Stevenson, Jordan and Harrison, Inc. for the Glass Container Association and covered data assembled during the year 1943.

The report endeavored to establish the variation in packaging and delivery costs or the cost differentials for a number of different styles of beer containers. It did not attempt to calculate the complete cost of a case of beer. No selling or administrative cost or profit figures were included. Neither were any tax allowances made.

The cost data included an arbitrary figure for the beer in each package, plus the cost of the cans or bottles, labels,

crowns, cases, direct and indirect labor, overhead, and wholesaler or distributor and retail delivery costs.

The survey included six breweries, two in the East, three in the Middle West and one in the West. It also included nine distributors, three in the East, three in the Middle West, and three in the West. Large and small breweries and distributors were included.

Actual cost and time studies were made on 12 and 32 ounce export and steinie bottles; one-trip bottle costs were estimated by adjusting the army overseas pack costs; can costs were estimated based on available records from past can operations.

Returnable bottles were estimated to make 18.3 trips, wood cases—25 trips and returnable cartons—10 trips.

Drivers' wholesale and retail delivery times were determined by time studies.

[fol. 1172] The beer cost was fixed for all 12 ounce and 32 ounce containers and was calculated on a beer cost of $2.75 per barrel less 2 percent loss and one barrel was estimated to yield 13.50 cases of 12 ounce containers to cost $.2037 per case and 10.13 cases of 32 ounce containers to cost $.2715 per case. These figures were employed throughout the study for the beer cost regardless of type of container.

The following prices for bottles and cans were used for all breweries:

	Per Gross	Per Thousand	Per Case
12 oz. Export Bottles	$2.90	$20.14	$.4834
12 oz. Steinie Bottles	2.60	18.06	.4334
12 oz. Single-trip Bottles and Cartons	2.35	16.32	.3917
12 oz. Cone-top Cans and Cartons	3.49	24.24	.5818
12 oz. Flat-top Cans and Cartons	3.43	23.85	.5724
32 oz. Returnable Bottles	4.65	32.29	.3875

Hourly labor rates in the breweries ranged from $.92½ to $1.27 per hour plus payroll taxes. In warehouses they ranged from $.67 to $1.04 per hour. On delivery trucks drivers ranged from $.72 to $1.70 and helpers $.57 to $1.21 per hour.

Below we are summarizing briefly the information appearing in the articles:

(1) The high original cost of the single-trip package is emphasized—both for the cans and the one-trip bottle—as against the returnable bottle.

(2) The articles indicate the extent to which the economies derived through use of single-trip packages tend to offset a portion of their higher original cost.

(3) Labor man hours required in the brewery packaging operations were estimated as being reduced by 1/3 when 12 ounce flat top cans were used as against an equal quantity of returnable or single-trip bottles.

(4) Higher overhead costs per case were indicated for the returnable bottle as against either the one-trip bottle or the flat top can.

[fol. 1173] (5) The following summary was made of the cost per case of beer packaged in various packages.

Cost Per Case of Beer at the Brewery When Packed in the Following Style of Packages

	Average Cost per Case
12 oz. Steinie—Wood Case	$.4402
12 oz. Steinie—Returnable Carton	.4342
12 oz. Export—Wood Case	.4593
12 oz. Export—Returnable Carton	.4577
12 oz. Single-Trip Bottle—Carton	.7647
12 oz. Flat Top Can—Carton	.8812
12 oz. Cone Top Can—Carton	.9068
32 oz.—Wood Case	.5055
32 oz.—Returnable Carton	.5050

(6) The articles indicate that the use of cans makes possible a 33 to 39 percent reduction in delivery time when making wholesale truck deliveries as compared to the returnable bottle.

(7) A 22 to 27 percent time saving in retail delivery time is effected through use of the can over the returnable bottle.

The average saving in wholesale and retail deliveries in cents per case through use of the non-returnable packages over returnable packages was estimated at 4.66 cents per case.

(8) It was estimated it costs a retail store from 2.9 to 6.4 cents to handle each case of empties.

(9) The articles indicated that the increased 12 ounce flat top and 12 ounce cone top can cost differentials

over the 12 ounce single-trip bottle; the 12 ounce steinie bottle in a returnable carton; the 12 ounce steinie bottle in a returnable wood case or the 12 ounce export bottle in a returnable wood case, delivered at the following shipping destinations, were as follows:

Increased Delivered Cost Differentials of the 12 Oz. Flat Top Can Over Competing Beer Packages

Type of Beer Package	New York City to: Local Del. by Brewery	Hartford 108 Mi.	Boston 229 Mi.	Buffalo 396 Mi.	Cleveland 580 Mi.	Chicago 907 Mi.
Single-Trip Bottle	.117	.104	.100	.096	.092	.084
Steinie Bottle Returnable Carton. Export Bottle Wood Case	.416	.349	.333	.317	.302	.271
	.391	.292	.265	.239	.216	.166

[fol. 1174] Increased Delivered Cost Differentials of the 12 Oz. Cone Top Can Over Competing Beer Packages

Type of Beer Package	New York City to: Local Del. by Brewery	Hartford 108 Mi.	Boston 229 Mi.	Buffalo 396 Mi.	Cleveland 580 Mi.	Chicago 907 Mi.
Single-Trip Bottle	.142	.131	.128	.124	.121	.115
Steinie Bottle Returnable Carton. Export Bottle Wood Case	.442	.376	.361	.345	.331	.302
	.417	.319	.293	.268	.245	.196

(10) The articles point out that all the savings which might accrue through use of single-trip containers have not as yet been determined. It emphasizes their popularity and expresses the opinion that a cost differential of approximately 25 cents per case against the cans could be absorbed due to savings incurred through use of a single-trip container.

In abstracting and preparing the series of articles from the original report they were greatly expanded. This did

---

Note: The figures shown are based on the 1943 survey. Since that time freight, labor, package and other costs have increased. The differential against the can has increased due to a greater proportionate increase in can prices.

not make for brevity and to a degree makes it difficult to absorb their contents.

In order to save time we have grouped the various articles according to the subject covered and if they are read in the order indicated, we believe you will be able to secure a good knowledge of the operations involved and also the cost, by operation, of packaging beer.

Subject and Articles

Beer, Container, Label, Crown and Case Costs at Brewery

See Article—"How Crowns, Labels and Cases Affect Total Packaging Costs"

Packaging Labor Costs and Labor Man Hours per Case of Beer at Brewery

See Articles—"Why and Where Packaging Costs Vary"
—"How Man Hours Affects Packaging Costs"
—"Man Power—The Key to Bottling Costs"
—"The Effect of Wages on Brewery Packaging Costs"

[fol. 1175] Packaging Overhead Expense

See Article—"Overhead—How It Affects the Cost of Beer"

Summary of Packaging Cost at Brewery

See Article—"Why Beer Packaging Costs Can Be Further Lowered"

Warehousing and Delivery Costs for Each Style Container

While there are many variations in methods employed to deliver beer from the brewery three principal ones are used.

(1) Retail deliveries direct from brewery
(2) Wholesale deliveries to local branches, with empties returned to brewery by the retail delivery trucks.
(3) Wholesale deliveries to branches or distributors where full cases or empty cases must be warehoused.

These costs are analyzed in the three following articles:

(1) "Transportation Costs in the Wholesale Distribution of Beer" (or from Brewer to Wholesale Distributor)
(2) "Transportation Costs in the Retail Distribution of Beer" (or from Wholesale Distributor to Retailer)
(3) "How Delivery and Warehousing Affect Total Cost of Beer Distribution."

Effect of Shipping Distance on Cost of Delivering Beer in Various Styles of Packages

A comparison was made in three articles of the shipping and delivery problem and costs as presented (1) by the varying shipping weights of the different style containers and (2) by container returns.

The articles also indicated the difference in cost between the various packages, when shipped to destinations at varying distances from the brewery.

The three articles are as follow:

"Effect of Package on Competitive Position of Large Brewing Centers"
"Analysis of Delivery Costs Shows Wide Variation in Distribution Methods"
"How Costs Were Determined in Analysis of Beer Packaging and Delivery"

[fol. 1176] Savings in Retail Stores Through Use of Non-Returnable Containers

See Article—"Analyzing the Advantages of the Single-trip Container"

As stated before the figures represent conditions in 1943 and in order to have a more up-to-date comparison, we will endeavor to adjust the figures for the increased container costs, labor expense and added freight charges and send you this data at a later date. Any figures sent would only be approximate as this is the best we will be able to do with the data available.

The articles represent a rather interesting packaging study and while they indicate the cans cost more than other

styles of containers, the differentials are not as large as are frequently reported. The articles also emphasize where the can saves money.

In view of the fact the information is not current, discretion will have to be exercised in its use.

#43—Head Office
Mr. T. C. Fogarty June 10, 1947.

Comparative Cost Differentials for Beer Packages
Glass Bottles vs. Metal Cans

We have reviewed the Stevenson, Jordan & Harrison survey on beer packaging dated June 20, 1944. This was prepared for the Glass Container Association and reported certain beer packaging and distribution costs for the year 1943. The figures as shown in the report indicated the extra cost differential incurred through the use of cans as against various styles of bottles, when both were employed for local delivery and to points up to 907 miles from a brewery, using New York as the point of origin.

The report also endeavored to establish the variation in packaging and delivery costs or the cost differentials for a number of different styles of beer containers. It did not attempt to calculate the complete cost of a case of beer. No selling or administrative cost or profit figures were included. Neither were any tax allowances made.

The cost data included an arbitrary figure for the beer in each package, plus the cost of the cans or bottles, labels, crowns, cases, direct and indirect labor, overhead, and wholesaler or distributor and retail delivery costs.

The survey included six breweries, two in the East, three in the Middle West and one in the West. It also included nine distributors, three in the East, three in the Middle West, and three in the West. Large and small breweries and distributors were included.

The entire report is covered in a special abstract dated June 4 compiled by this department. We have, in addition, prepared the following data from the report and which we believe will give you the most important comparative figures between cans and bottles.

Table No. 1

This table indicates the cost of beer in the various styles of packages when delivered either locally by the brewer or distributor or as far as Chicago—907 miles from New York.

On this table we show the 1943 reported cost and have added figures to adjust for estimated 1947 increased package cost, labor (plus 30%) and freight cost.

Table No. 2

This table indicates the cost advantage of one style of bottle over other styles of bottles also over metal cans.

[fol. 1178] Table No. 3

This table indicates the increased cost differential of the 12 ounce flat top and 12 ounce cone top cans over the various types of bottles, when both style containers are used either for local delivery or for delivery 907 miles from New York.

Table No. 4

Miss Lynch has also prepared a chart which gives a visual picture of the delivered cost spreads between the various styles of containers.

It must be kept in mind all figures indicate only approximate packaging differentials.

Bottle and Can Cost Per Case and Per Trip

Below is a comparison of the per case and per trip cost of bottles and cans as between 1943 and 1947. Returnable bottles are estimated to make 18.3 trips and returnable cartons—10 trips.

	1943		1947		
	Per Case	Per Trip	Per Case	Per Trip	
12 oz. Export Bottle—	.4834	.0267	.6715	.0367	
Add—Returnable Cartons	.2250	.0225	.2250	.0225	
		.0492		.0591	(.0792)
12 oz. Steinie Bottle—	.4334	.0237	.6031	.0330	
Add—Returnable Cartons	.2530	.0253	.2530	.0253	
		.0490		.0583	(.0783)
12 oz. Single Trip Bottle and Cartons	.3917	.3917	.4560	.4560	
	.....	.....	.4320	.4320	
12 oz. Cone Top Can and Cartons	.5818	.5818	.68948	.68948	
12 oz. Flat Top Can and Cartons	.5724	.5724	.66148	.66148	

[fol. 1179] Note: Bottle costs are delivered; can costs shown are f.o.b. can factory and we have added 3 cents per case freight to build up delivered prices in other tables in this report.

Two prices are shown for single trip bottles—one for the 7 3/8 ounce and the other for the new 6½ ounce.

1947—returnable carton prices are low and we have estimated the per trip cost should be increased by approximately 2 cents.

Cost For Case of Filled Beer at the Brewery

The cost of a filled case of beer at the brewery—using only the packaging costs, plus labor and overhead, and adding an arbitrary beer cost figure of 20.37 cents for each case of 24/12 ounce and 27.15 cents for each case of 12/32 ounce containers was estimated to be as shown below. The 1943 figures are from the report and the 1947 figures were estimated.

Type of Package	1943 Cost per Case	1947 Estimated Cost per Case
12 oz. Steinie—wood case	.4402	.4827
12 oz. Steinie—returnable carton	.4342	.4749
12 oz. Export—wood case	.4593	.5071
12 oz. Export—returnable carton	.4577	.5067
32 oz. Quart—wood case	.5055	.5554
32 oz. Quart—returnable carton	.5050	.5541
12 oz. Single Trip Bottle—carton	.7647	.83412
12 oz. Flat Top Can—carton	.8812	1.0227
12 oz. Cone Top Can—carton	.9068	1.0614

The can cost differential increased during 1947 over 1943, due to the greater proportional can and can carton price rise. Due to the 16.3 trippage estimated for bottles any increase in returnable bottle cost shows up only as a very small added amount. The same applies to returnable wood cases which are estimated to make 25 trips and returnable cartons—estimated to make 10 trips. In comparing the figures we believe approximately 2 cents per case should be added to the 1947 returnable bottle case costs, as our costs are low.

[fol. 1180] The can and can carton costs were increased over the 1943 report figures by approximately 10.532 cents per case of 24/12 ounce cone top cans and 8.908 cents per

case of 12 ounce flat top cans. Three cents per case was added for freight on cans from factories to brewery as this figure was omitted in the original report. Other figures which we have indicate can and can carton cost increases per case from 1941 to 1947 for the 12 ounce cone top can were 10.154 cents and for the flat top can—9.754 cents per case.

* * * * * * * * *

We do not believe that, up to the present time, the cost savings and conveniences which result from use of a one trip can have been fully determined. We do know there is a decided demand for non-returnable packages and this situation may influence the industry to accept smaller profit margins in order to meet consumer preferences.

The ultimate consumer, we believe, may possibly pay 1 cent more for a 12 ounce can than for the 12 ounce bottle of beer. However, we question if they will pay a larger amount. Any further difference will probably have to be contributed by the brewer, distributor or retailer.

This article gives a reasonably complete picture of the cost of packaging beer in cans and bottles and indicates the form of procedure that might be followed if up-to-date and more accurate data is desired.

Comparative Delivered Costs

12 Oz. Non-Returnable Beer Bottle

vs.

12 Oz. Flat Top and Cap Sealed Beer Cans

Estimated Delivered Cost to Brewer in Eastern Area of 12 Ounce Light Weight Non-Returnable Bottles vs. 12 Ounce Cans—Flat Top and Cap Sealed—Case of 24 each.

12 Ounce—Non-Returnable Bottle—Light Weight—6½ Oz.—Cost per Case

Delivered Cost to Brewer (Eastern Area) including Cartons $2.60 per Gross

Cost per case of 24, including carton	$.4320
Add—cost of labels	.0113
Add—cost of applying labels	.0044
	.4477
Add—cost of spotted crowns	.0366
Total Cost per Case—24 Bottles	$.4843

12 Ounce Cans—Cost per Case

Jersey City Basis

Cans—Flat Top and Cap Sealed	Flat Top at $24.09 per M	Cap Sealed at $24.84 per M
Cost per case of [illegible] cans—no cartons	$.57816	$.59616
Cartons at $80.25+6.50 setup charge	.08675	.....
Cartons at $84.25+6.50 setup charge	.....	.09075
Cost per case of cans f.o.b. our factory	.66491	.68691
Est. Dlv'd Freight—Case 24 cans—.50 per cwt.	.02550	.02550
Est. Delivered Cost of Cans—Case	.69041	.71241
Est. Delivered Cost of Bottles—Case	.48430	.44770
Extra Cost per Case—Cans over Bottles	.20611	.26471

Note.—Cost of crowns has been added to bottle cost when compared to Flat Top cans and omitted when compared to Cap Sealed cans as cap cost would be the same on cap sealed cans and bottles.

[fol. 1182]

—The freight charge added to make up the delivered can cost would vary, in any comparison made, with the shipping distance. The 50 cent per cwt. figure shown represents the current freight rate from Jersey City to Boston or approximately 229 miles. This charge of .0255 cents per case, could be adjusted for shorter distance deliveries.

Estimated Shipping Weights per Case

	Empty	Filled
24—12 Oz. Flat Top—Cans	5.09#	24.50#
24—12 Oz. Cap Sealed—Cans	5.09	25.00
24—12 Oz. Non-Returnable—Bottles	11.66	29.66

[fol. 1183] GOVERNMENT'S EXHIBIT 438

Continental Can Company, Inc.
100 East 42nd Street
New York 17, N. Y.

June 30, 1949.

To: All District Sales Managers

Subject: One-Way Single Trip Beer Bottle Prices
GB-6-Style—6½ oz. weight
GB-8-Style—8 oz. weight

The attached subject information compares the new one-way beer bottle prices with those previously in effect for both the GB-6 and GB-8 style containers. We have also indicated descriptive information concerning the various types of carriers, and have given an example showing the cost to the brewer of each bottle style packed in Alpak Carriers.

Concerning these price reductions, the glass company claims their volume on one-way beer bottles is picking up, and the increased activity justifies doing all that is possible to create an even larger demand for this package. With this regard, glass container salesmen are requested to urge their customers to apply at least a portion of these savings from lower packaged prices towards advertising and merchandising the one-way glass beer bottle.

Actually, non-returnable beer bottle shipments during the first four months of this year are lagging approximately 1.5 million units or 1.2% behind the same period last year. This price reduction may, therefore, be regarded as a further attempt on the part of the glass manufacturers to maintain their position in the one-way package field.

Continental Can Company, Inc.
Inter-Company Memorandum

To: Location #43—Head Office
Attention: Mr. M. M. Dukehart
From: Location #43—Head Office
Date: October 31, 1952
Subject: Beer Packages Smaller Than 12 Ounces

The attached report, "Current and Prospective Markets for Beer Packages Smaller Than 12 Ounces" summarizes current usage of American Can Company's 211 x 306 8 ounce beer can, discusses the market for less-than-12 ounce beer packages in general, and evaluates the request by Storz of Omaha that Continental produce a redesigned 8 ounce can.

American Can supplies three brewers with 8 ounce cans from Chicago, and is now reported to have installed a second 8 ounce line to meet its demands. Two of these three brewers, Goetz of St. Joseph, Missouri, and Goebel of Detroit, have had significant success with this can, but in both cases this success has been with products *not* packaged in 12 ounce cans or 12 ounce export bottles. In the two instances where the same brand of beer has been marketed in both 8 and 12 ounce cans, sales of the 8 ounce package have been so small as to make any comparison of limited value.

The market for beer in less-than-12 ounce units (bottles and cans) as a whole requires further study but it is apparent that the pressure of inflation, tax rises and the trend toward smaller beer packages provide a sound basis for expecting a substantial, if minor, portion of the total packaged beer market to be sold in "small" units. While bottles may have a slight advantage cost-wise over cans in this size range, the can will undoubtedly share in this market segment.

Although the 211 x 306 size now produced by American Can is the least expensive 8 ounce can for a producer of 211 x 413 beer cans to manufacture, it is possible that a design more nearly proportional to a 7 ounce bottle will be desired by the brewing industry.

One brewer, Storz of Omaha, has already requested such a design for its proposed beer for women, knowledge of which, incidentally, is held in strict confidence by Continental.

This report concludes that the market for small beer packages is worthy of continued study and recommends that research be conducted on a new design for a 7 or 8 ounce can and that a consumer survey of beer container design be made in 1953. Furthermore, it is recommended that Continental offer to supply both Goetz and Storz with 211 x 306 8 ounce cans, pending the outcome of such research.

[fol. 1189] Current and Prospective Markets for Beer Packages Smaller Than 12 Ounces

Attention has again been focused on the market for small beer packages and, particularly, for an 8 ounce can. Calls were made at the end of September, 1952 on several brewers currently using, or considering the use of, the 8 ounce can, and an analysis of the information thus obtained is presented.

The long-term trend in beer containers toward smaller sizes has generally stabilized, for the time being, at least, on the 12 ounce unit, although the size range presently extends from the 7 ounce "split" to the 32 ounce quart. The 8 ounce can is apparently about two years old and has been produced solely by American Can in Chicago. This current, and only, style is a "sawed off" 12 ounce flat top beer can, with dimensions of 211 x 306.

Only three brewers are known to have made use of this 8 ounce can, although the 7 ounce bottle is not uncommon among a number of brands. These three brewers, and the products packed, are:

1. M. K. Goetz Brewing Company, St. Joseph, Missouri

Goetz produces essentially two products, its Country Club Beer and its Country Club Malt Liquor. The beer is a popular priced brand and is marketed in the area surrounding Kansas City in 12 ounce bottles (export and one-way) and cans, and in 8 ounce cans. The malt liquor is a stronger, stout-like brew, selling at a premium price in 12 ounce one-way bottles and 8-ounce cans. The malt liquor, however while available locally, is distributed primarily in the Southwest and California, and not in the same distribution areas as their beer.

Goetz is very well pleased with the acceptance of its malt liquor, a major portion of which is being packaged in 8 ounce cans. (Goetz estimates that 80% of its California malt liquor sales is in cans.) On the other hand, sales of Goetz' *standard beer* in 8 ounce cans are negligible, although this package has not been aggressively promoted. This small can for Goetz' Country Club Beer was well received by the trade but consumer sales have been so small as to render meaningless any at-

tempt to measure its effect on sales of Country Club Beer in other containers, 12 ounce cans in particular.

Typical retail price comparisons among Goetz products in Kansas City, Missouri are as follows:

	Goetz Country Club Beer	Goetz Country Club Malt Liquor
6 12 oz. export bottles	$.85 plus dep.	—
6 12 oz. cans	.96- .98	—
6 12 oz. one-way bottles	.96- .98	$1.15
6 8 oz. cans	.72- .90	.95- .99

[fol. 1190] This year is Goetz' first full test of its malt liquor and of the 8 ounce package. It is now filling 8 ounce malt liquor cans at the rate of 1½ million units per week and expects to be up 2½ million by next spring. This translates into annual 8 ounce can requirements of about 36 million for 1952 and perhaps 50—60 million for 1953, almost all of which should be for *malt liquor*. Goetz states that its requirements are now taking 75% of American Can Company's total 8 ounce can output (or 36 out of 50 million annually), but American is reportedly starting production on a second 8 ounce line in Chicago this month.

Mr. Byron Means, Assistant Secretary and Comptroller of Goetz, indicates that his firm is not particularly pushing *smaller packages* (no smaller-than-12 ounce bottles are filled), nor has any thought been given to a 16 ounce package to complement the 8 ounce can. The malt liquor is a premium product (distributed through liquor distributors on the West Coast) and the small can not only reduces the apparent price but also provides a smaller consumption unit of a product which is considerably stronger (6% alcohol by weight) than standard beer.

2. Goebel Brewing Company, Detroit, Michigan

The Goebel Brewing Company, with two plants in Detroit, one in Muskegon, Michigan (draught only), and one in Oakland, California, is something of a hybrid between a regional brewer and a national brewer. Although its market penetration is probably strongest in the Lower Lakes area, it does sell its products from coast to coast in a wide scattering of states. Goebel

brews only one beer but markets this same beer under two ostensibly different brand names, Goebel Private Stock 22 Beer, and Bantam Beer by Goebel. Private Stock 22 sells at competitive popular prices in 12 ounce export and one-way bottles and cans, while Goebel Bantam is available only in 8 ounce cans and 7 ounce bottles. Since the term "bantam" means "small" or "diminutive", the name is a merchandising natural as applied solely to the 7 and 8 ounce packages. However, in spite of the fact that a "Private Stock 22" insigne appears on the Bantam container, it is apparent that a substantial portion of the public considers the Bantam Beer to be a separate, distinct and possibly superior brew as contrasted to the same beer sold in the 12 ounce package.

According to Mr. Robert Shiffer, Assistant General Sales Manager of Goebel, the 7 ounce bottle was first introduced by Goebel in Michigan as an attempt to place a "good" 5¢ packaged beer on the market. However, the resistance by Michigan tavernkeepers was so great that it was withdrawn and remarketed out-of-state at 10¢ where it met with substantial success. Goebel then began experimenting with a small can, but found that a 7 ounce can was too squat in appearance and settled on the 8 ounce size now obtained from American Can in Chicago. Goebel is completely satisfied with the size and proportions of this 211 x 306 beer can.

[fol. 1191] Sample prices for Goebel beer in the Detroit, Michigan market are:

	Goebel Private Stock 22 Beer	Goebel Bantam Beer
6 12 oz. export bottles	$.74–.78 plus dep.	–
6 12 oz. cans	.95–1.00	–
6 12 oz. one-way bottles	.87	–
6 8 oz. cans	–	$.75–.76
6 7 oz. export bottles*	–	.54 plus dep.

* It is believed but not confirmed that 7 ounce one-way bottles are also used.

Goebel appears to follow a distribution policy of least resistance, particularly with regard to its Bantam Beer, in that it adapts its emphasis to the particular container that seems to take hold. The 7 ounce bottle is marketed in the Northeast, the Midwest and on the West Coast,

with the 8 ounce can fitting in where it will sell. The Bantam can is not available in the Far West, perhaps because of the lack of suitable filling equipment in Oakland, even though the can can easily be run on a 12 ounce line with height change parts. In Ohio, Goebel Bantam Ale, but not Bantam Beer, is sold in 8 ounce cans due to a legal restriction on *beer* in small containers.

Mr. Ted Goebel, Purchasing Agent of the Goebel firm, estimates his current 8 ounce can requirements to be 30 million units annually, which coupled with the needs of Goetz, would certainly seem to overtax American's single line capacity and would aid in explaining the addition of a second line in Chicago. While possibly on the optimistic side, cross-checking with other data obtained from Goebel and outside sources indicates that this figure could fit satisfactorily into the following estimated construction of Goebel's package distribution pattern, which is based on the ratios existing in July, 1952 and probably does not include the California operation.

Total Goebel Sales	100%		
Draught	15%		
Packaged	85%	100%	
Bottles as % of Total Packaged		83%	100%
12 oz. export & one-way		58%	70%
7 oz. Bantam bottles		25%	30%
Cans as % of Total Packaged		13%	100%
12 oz. flat top cans		8%	60%
8 oz. Bantam cans		5%	40%

If these ratios are indicative, Goebel Bantam Beer accounts for nearly one-third of total Packaged sales, and Bantam cans, for almost one-half of the total Goebel can requirements. Even if somewhat overstated, these proportions are significantly high. One-way bottles have not been a singularly successful package except where they have been promoted *and* where the price differential has been passed on to the consumer. Goebel considers that 90% of its 8 ounce can volume is additional business and, particularly with the separate label, has little effect on its 12 ounce can sales. Importantly, the 7 ounce Bantam bottle has does well in on-premise con-

sumption only, while the 8 ounce Bantam can is primarily an off-premise item.

[fol. 1192] The firm believes that the appeal of the small package to women is a significant factor. Mr. Shiffer considers the 12 ounce size the standard package for most beer in general and doubts that the smaller containers will make serious inroads on the 12 ounce. No thought has been given to a 16 ounce size to accompany the Bantam and the one-way glass bottle is believed to have a limited future relative to the can.

3. Pittsburgh Brewing Company, Pittsburgh, Pennsylvania

Pittsburgh Brewing, with two plants in Pittsburgh, is a large volume brewer in its area, marketing two primary brands of beer at the same popular price. These are: Iron City Beer, packaged in 12 ounce export and one-way bottles and cone top cans, and Tech Beer, available in 12 ounce export bottles, 8 ounce "Gem Size" cans (from American Can), and 7 ounce select bottles. A third brand, Dutch Club Beer, is apparently of minor consequence and may well be dropped.

Tech "Premium" Beer (called premium although sold at popular prices) was originally marketed in 12 ounce export bottles, the Gem Size 8 ounce can having been added in 1950. This brewer was not interviewed directly but it is understood through Continental's Pittsburgh office that the sale of the Tech Gem has been somewhat disappointing. Estimated usage of 8 ounce cans is about 3 million annually, which is considerably less than Pittsburgh's cone top requirements and a decimal of the volume of small cans reportedly used by both Goetz and Goebel. Nevertheless, there are no known indications that abandonment of the Gem Size is contemplated at the present time.

In addition to these three firms currently packaging beer in the 8 ounce flat top can made by American, part of the management of a fourth, Storz Brewing Company of

Omaha, Nebraska, is seriously interested in the use of a small can for the marketing of a new beer to be tailored especially for women. Their ideas is as follows:

Storz Brewing Company, Omaha, Nebraska

Although Storz is not so large a brewer as Goetz, Goebel or Pittsburgh, this firm has an enviable dominance of the Omaha beer market. Furthermore, this leadership has been achieved not so much through the sale of Storz Triumph Beer, a popularly priced product, but rather through the sale of Storz Premium Dry Select Beer, which retails at prices between those of the popular beers and those of the national premium brands. Storz appears to be aggressively promotion-minded and utilizes export and one-way bottles and flat top cans.

Mr. Robert Storz, Vice-President, Secretary, and Sales and Advertising Manager of the firm, is desirous of persuading the rest of his management to market a special beer, brewed and packaged solely for women. He and his staff have conducted some intensive research on beer consumption habits and have concluded that, while some 62% of the populace drinks beer, over half of all male beer drinkers, and well over three-fourths of all female beer drinkers, drink beer only occasionally (one to three 12 ounce units per week). Among consumer objections to beer, its tendency to be too filling and its bitter taste were the most important. Mr. Storz furthermore pointed to the general association of beer as a man's drink, despite the recent tendency toward "pale dry" beers noted in so many markets, and to the historic trend among beer containers toward smaller packages.

[fol. 1193] Mr. Storz is convinced that the market is ripe for the introduction of a beer so brewed as to suit the female taste and so packaged in a feministically decorated container as to suggest its purpose on sight. He believes that a major way to increase beer sales is to increase the per capita consumption of female beer drinkers who are overwhelmingly in the

"occasional" class. Consequently he and his associates, who have been counseled by a Mr. Richard R. Fowler, a marketing consultant, who is also merchandising director for the National Beer Wholesalers Association, have applied for trade marks on the names "Storzette" and "Beerette" and intend to use the former in particular for their new feminine brew. Their thought is to employ a small package (the 7 ounce one-way clear glass bottle and an 8 ounce can) in order to provide a unit of consumption more desirable to women. Both label and container design would be unmistakably based on an appeal to women, so much so as almost to resemble cosmetic products, for example. While certain states, including Nebraska, have statutory minimum size limits for beer containers, thus posing certain but not insurmountable problems to Storz, the 7 and 8 ounce packages are favored because of the apparent incidence of beverage tax rises, the mass market appeal to occasional and non-beer drinkers, the novelty of a small package, and the long-term trend to smaller containers. Mr. Storz proposes to price his new product on the basis of Storzette Beer in 8 ounce cans, so that the 7 ounce bottle sales would be the more profitable item, since the container cost is less and a smaller quantity of beer is involved. The can, however, would as much as halve the cost per package of 6 unit paper-board pack carriers, in that a 6 can carrier costs roughly .4¢ per can, whereas a 6 bottle carrier would cost closer to .8¢.

Storz currently calculates that its cost of putting the 8 ounce Storzette can on the market is close to that of its 12 ounce can of beer, as shown:

Dock cost (and price), 24 12 oz. cans (288 oz.) $2.69

Estimated dock cost, 24 8 oz. Storzette cans (192 oz.) $2.36

Anticipated dock price 24 8 oz Storzette cans (192 oz.) $2.55

(7 ounce one-way Storzette bottle would presumably sell for close to this 8 ounce can price)

Of major significance is the fact that Storzette would not be sold in any of Storz' regular beer distributing areas, but would be exported to California and the West Coast where a more urban and possibly more sophisticated market might be found. While recognizing that the project could be a complete failure, Mr. Storz believes that by the middle of next year, the Storzette potential *could* well be 75,000 barrels annually. This translates into some 35 to 40 million 7 and 8 ounce units. The West Coast not only is viewed as a probably more receptive market for such a product, but it is believed that Storzette would be a most effective entrant in creating acceptance of Storz products in general in such a new marketing area.

[fol. 1194] Having developed the essence of a new product marketing program as they have, this Storz group is primarily concerned with the container and its design. While there does exist division of opinion as to whether the can or the bottle is the preferable package for such a product, there is no doubt in the group's mind that the American Can 211 x 306 8 ounce can is too squat for their satisfaction. Consequently, they wish Continental to consider the manufacture of an 8 ounce beer can of a smaller diameter and larger height than the current American Can model. It is their belief that such a can would be a much more graceful and appealing Storzette container companion to the slender 7 ounce bottle.

Conclusion

The subject at hand is divisible into three main and interrelated categories:

1. The market for "small" beer packages.
2. The competitive position of the "small" beer can in this market segment.
3. The most desirable can style and dimensions in the "small" beer can field.

1. The market for "small" beer packages.

A period of inflation, despite its reduction of purchasing power, gives an impetus to smaller packages of all sorts in order to reduce the apparent effect of product price rises. This, coupled with concurrent tax increases and the admitted trend from larger to smaller beer packages, is sufficient to explain the observed increase in the number of 7 and 8 ounce beer containers being filled. There is obviously a physical and economical limit to which such container size reduction can go, and the test of the permanence and size of such a container demand will occur after the readjustment of the consumer to his new effective income and to the new packages from the point of actual cost per unit of beer, and convenience and appeal of the smaller units. If the smaller packages can increase beer consumption in the "occasional" drinker category, and cause some non-drinkers at least to enter the "occasional" class, then, even though there may be a compensatory switch of 12 ounce unit drinkers to smaller containers, the small package will become a permanent factor which few competitive brewers will be able to ignore. If such events should come to pass, it would be logical to expect the development of a 14 to 16 ounce "economy" size to offset the competing effects of the small sizes on the sale of beer in 12 ounce units. There is no indication of such a trend at the present time. In some states, the 12 ounce container is protected, for the time, at least, by minimum container size laws.

2. The competitive position of the "small" beer can.

The market position of the beer can relative to bottles is certainly not improved by the introduction of smaller packages. Since the value per unit of beer is greater than that of soft drinks, the can does not meet the [fol. 1195] same obstacles it does in that field. However, since an 8 ounce can is presently in effect being compared with a 7 ounce bottle, the unit price advantage lies even more than normally with the bottle. Such present size standardization is perhaps unfortunate for the can, but it exists. Nevertheless, any suc-

cessful use of small bottles in large quantities will most likely be accompanied by similar use of cans because of their strong acceptance in the 12 ounce size. Of the three brewers currently using the 211 x 306 8 ounce beer cans made by American Can Company, two have had very little success with it for a standard beer which was and is packed in other containers. However, one of these two, plus the third, have enjoyed substantial sales in 8 ounce cans of *unique* beer products, namely a malt liquor selling at a premium price, and a standard beer so marketed as to identify the product solely with small containers. Furthermore, a fourth firm, contemplating the use of an 8 ounce can, would use it only for a uniquely premium brew—a beer for women. There has been so far no clear-cut test of the 8 ounce can as a container for standard beers in general. Evidences for this purpose which do exist are generally negative. However, future use of this can for premium products and by brewers wishing to differentiate their standard beers is not unlikely. The introduction of a second 8 ounce line by American Can is quiet indication that there is a definite market for such a size.

3. The most desirable can style and dimensions.

This problem can be decided only in the market or by competent consumer interrogation. While the users of the 211 x 306 beer can are apparently satisfied with it, they would probably accept one that is less stubby. One brewer contemplating the use of an 8 ounce container, however, is strong in his objections to the wide diameter of the current can and wishes one that is more nearly proportional to a 7 ounce bottle in comparison.

This brewer, Storz of Omaha, is contemplating the introduction of a novel product, a women's beer, and it seems logical that the firm might do all it can to minimize its investment in this risk venture, at least until public acceptance has been established for Storzette (its women's brew). In this connection, the use

by Storz of a 7 ounce bottle for its initial market test purposes would be most economical, with the development and use of a suitable small can following if the product itself is a success and the market seems receptive to a can as well as the bottle. If a can is considered desirable, a test of the acceptance of Storzette in cans could most economically be conducted through the use, either concurrently with the introduction of Storzette in bottles or after product acceptance has been determined, of a "standard" 211 x 306 8 ounce can.

In general, the market for small beer packages is still nebulous and, for the small beer can, it is even more so. In spite of the observations that no small beer package, and particularly no small can, are making outstanding inroads as containers in the beer market, there appears to be enough interest in the subject to suggest that there exists a strong possibility that the small package will in time command a minor but nevertheless significant share of this market. Since this situation could develop with surprising rapidity in the event that one or more of the [fol. 1196] major brewers places emphasis on a small package, it seems desirable that Continental begin research on a 7 or 8 ounce beer can of more appropriate dimensions than, but costwise competitive with, the 211 x 306 beer can, in order that the Company not lose ground in its competitive position in the total beer container market because of its failure to anticipate new product developments. In the interim, the supplying of a portion of Goetz' 8 ounce can requirements through the use of change parts on a 211 x 413 beer can line would not only assure the brewing industry that Continental is desirous of satisfying its varying needs but would also provide the Company with desirable experience in the field of small beer containers.

Recommendations

1. That Continental continue to keep very close watch on the small beer package market (both bottles and cans) and also keep informed on any tendency toward larger containers up to 16 ounces.

2. That Continental institute research on a 7 or 8 ounce beer can of appropriate dimensions, design and cost so as to be fully prepared for the possibility that the brewing industry will desire such a container in substantial quantities in the next few years.

3. That Continental suggest to Storz that

a. Storz initially market its projected beer for women, Storzette, in 7 ounce bottles only, in order to test its acceptance at minimal cost;

b. If the product, Storzette, is itself successful, Continental will provide Storz with 211 x 306 8 ounce cans for market testing of Storzette in small cans and at the same time will work with Storz on the design of a more proportional can;

c. Continental will, if Storz is particularly desirous of marketing Storzette initially in *both* cans and bottles, provide Storz with 211 x 306 8 ounce cans made with height change parts on a standard beer can line, at the same time cooperating in the research on a more proportional can.

4. That Continental offer to produce 211 x 306 8 ounce beer cans for Goetz.

5. That Continental plan a survey in 1953 on consumer preferences for various types of beer containers.

Inter-Company Memorandum

To: Location, #43—New York
Attention: Mr. M. M. Dukehart, Jr.
From: Location, #43—New York
Date: January 29, 1952
Subject: The Future of Canned Beer

At Mr. Dake's request I am submitting a summary of the discussions we have had concerning the future of canned beer, and our views concerning the outlook under conditions foreseeable at the present time.

The real question today is what impact the restrictions on use of beer cans—and the resulting inroads which the non-returnable bottle has made, and will continue to hold, as long as restrictions are in effect—will ultimately have on future demand for beer cans when they again become freely obtainable. On the basis of our experience to date and our analysis of the economic and market factors involved, we might summarize our conclusions as follows:

1. There is no good evidence to date to suggest that cans have reached a saturation level in consumer demand, and that when freely available, they will not *continue* to make inroads on the returnable bottle.

2. It is becoming apparent that the new excise tax increase and the new O.P.S. allowed price increase on packaged beer are not likely to reverse or even halt the downward trend in draught beer sales and the upward trend in packaged beer sales.

3. There is no reason to believe that under the same conditions which prevailed before M-25 restrictions the one-way bottle will fare any better *in the long run* than it did when cans were freely available.

With metal cans under restrictions again this year (and likely to remain restricted through at least the 3rd quar-

ter) the one-way bottle will have a chance to further strengthen its foothold in the market. How serious this might be to the future of canned beer cannot, of course, be fully determined until cans are again freely available and all market forces are at work under free market conditions. In this connection, following the suggestions of Mr. Heusner (of Pabst) and Mr. Goodwin (of Falstaff), I have discussed with Mr. A. J. Wood, of the research organization bearing his name, the kind of survey his organization might conduct which would help us to determine the answer to that question. It was concluded at that time (December 1951) that an objective test could be made only at such time as consumers could exercise a free choice among available containers. I plan to discuss this subject again with Mr. Wood around April or May to see if conditions have changed sufficiently to warrant undertaking a market study of some kind.

[fol. 1198] Until conditions are right for testing the preferences of consumers (and of distributors) we can surmise that, barring major changes not yet apparent, the one-way bottle will have an up-hill and probably losing fight with the can once cans have again become freely available. The key factor, in our estimation, is *pricing*. And up to now the one-way bottle has been unable to realize effectively its claimed advantage in price. In a few local situations where a price differential, (approximately 20¢ per case) has been maintained all the way to the consumer, the one-way bottle, was able to make some inroads prior to the can shortage. However, in many instances where the brewers' platform price is lower, the difference has been absorbed in distribution channels so that the retail price is usually about equal to that of the can. In a recent spot check in New York City, New Jersey and Connecticut, it was found that among the popular brands, the 12 oz. unit sold for the same retail price, whether in one-way bottles, returnable bottles or cans; typically 15¢ or 16¢, with the price of the returnable bottle including a 2¢ deposit.

A rather significant test of the real acceptance of one-way bottles was gained during the late months of 1951, when temporarily cans were available in fairly adequate

supply. Statistics show that sales of one-way bottles to brewers dropped off very sharply, while can shipments for September through November were running at a level exceeding the inflated figures of the comparable months in 1950. This heavy volume of beer can shipments apparently moved quickly through the trade and into ultimate consumption, indicating that consumers were quick to return to the preferred can when they were able to exercise a choice. Interviews with retailers during December indicated that retailers were very quick to drop the one-way bottle as soon as they could get canned beer and were opposed to carrying both the one-way bottle and the can in the same brand. The typical attitude was that if the consumer preferred glass, he could buy the returnable bottle (and throw it away) for the same price as the one-way bottle. Recalling their experiences of last summer when cans were in short supply, the retailers interviewed indicated that most consumers who asked for canned beer would switch brands rather than take bottle beer.

The basic advantages of the can have not as yet been disturbed significantly by M-25 restrictions. The can is still accepted as the most convenient package and there still remains the old trade antagonism to the one-way bottle because of breakage, poor stacking features, and the reluctance to stock a third kind of package for each brand carried. Although more people have purchased and temporarily accepted the one-way bottle as a result of can restrictions, we do not believe that the one-way bottle has gained a real consumer franchise which can hold for the *long run*. Further, in a period of rising income, as we have experienced since 1949, consumer price consciousness to the extent of any small price advantage which the one-way bottle might be able to achieve, tends to be minimized. If in the future a business recession were to develop, which led to wide spread unemployment and curtailed buying power, price consciousness would naturally increase. However, during such a period (probably of no more than one to two years duration) price consciousness would be likely to result in a temporary increase in the proportion of packaged beer sold in *returnable* bottles and perhaps some shift to the more economical quart size. For the long run, how-

ever, the beer can has achieved a solid consumer acceptance, which was still growing at the time restrictions were applied.

[fol. 1199] Looking at the shorter range picture, and particularly toward the first full year in which cans will be freely available, it appears likely that the can may suffer a temporary set back. One-way bottles will be available in greater volume next summer, and will be pushed in greater volume until cans are available. Brewers are undoubtedly weary of allocations and restrictions and will turn to the one-way bottle to fill a vacuum in the supply of throw-way packages. This factor plus the more wide-spread experience of consumers with the one-way bottle during 1951 and 1952 will make it quite unlikely that beer can shipments in 1953 (assuming that cans will be freely available by then) will reach the level that would have been reached without the set back caused by M-25 restrictions. However, there is still good reason to believe that the factors which made for a high and rising consumer demand for beer cans before restrictions will again come into play when cans are freely available. Brewers will be quick to change back *to meet the demands of the trade and of consumers,* once they feel assured of a free supply of cans, provided that they are not tied up with long-term contracts for one-way bottles.

Thus if restrictions are removed by 1953, it is probable that by 1954 demand for beer cans should be returning to the trend level which would have been reached—approximately 7 billion units per year—if there had been no restrictions in 1951 or 1952. In order to help assure this future it would seem important that during the current period of restrictions we conduct a *missionary campaign* among our brewer customers, advising them against selling their future short by tying themselves too closely to one-way bottles as a *substitute* for metal cans.

Subject: Beer Containers in the Baltimore Market

In the course of keeping in touch with the current situation in the various important beer markets in the country, this Department has recently made a brief investigation of the Baltimore market as a *case study*. This was a follow-up on a similar investigation made in 1949, examining the unusual competitive situation between cans and one-way bottles. While the basic situation was found to be fairly similar, the information obtained may be of interest to you.

Baltimore is *unique* both as a cut-price beer market and as one where the one-way bottle has made strong inroads. The former situation has not only given prominence to the normal cost differentials among containers but has also, in conjunction with a strong promotional campaign by the glass industry and the Baltimore brewers, aided the one-way bottle in establishing a fairly strong market position.

Price competition is unusually keen in Baltimore for two main reasons: (1) Licensing arrangements permit a wide variety of outlets to sell packaged beer, and (2) Although the two leading local brewers, Gunther and National, dominate the scene, Baltimore is not a captive market and a variety of national, regional and local brands is available. It is the wide extent of retail distribution, however, which is the more important factor. Licenses may be obtained for beer only, beer and wine, and beer, wine and liquor; and establishments licensed for on-premise consumption may also sell packaged beer for off-premise consumption. Retail outlets for beer fall into four main categories:

1. Package Stores: Beer, wine and liquor, off-premise
2. Taverns: Beer, wine and liquor, on-and off-premise

3. Drug Stores: Beer, wine and, sometimes, liquor, off-premise
4. Food Stores: Beer, wine and, sometimes, liquor, off-premise

A few "carry-out" type of retail beer distributors also exist, but have not carried their specialty to the merchandising level found in and around Cincinnati, for instance.

Of major significance in the Baltimore beer market is the legal restriction against food and drug chains in regard to selling alcholic beverages. Only *one* store of a chain can possess a license to sell beer, wine and liquor. Consequently, super markets, which are mainly a chain operation (even if only a few units in number), are very unimportant in the Baltimore beer picture. This in turn tends to protect the small local food store which may then sell beer at a discount to attract food business. These stores, however, are similarly vulnerable to price competition from the neighborhood package store (which carries beer but *sells* liquor). The result is a relative surplus of retail beer outlets which inevitably leads to price cutting and demands for price-fixing.

[fol. 1201] Against this background, Baltimore was a market that was ripe for a promotional campaign by the glass manufacturers and the Baltimore brewers, in which a significant price differential between cans and one-way bottles would be passed on to the consumer. This campaign, aided by the limitations on metal can usage imposed by the Korean War, has been successful in making Baltimoreans aware of the price differential, in establishing the differential as part of the general price pattern, and in enabling one-way bottles to outsell cans.

The increase in one-way bottles sales has been largely at the expense of cans, with the combined total of cans and one-way bottles remaining fairly well in line with the national average—about 30 to 35% of total packaged beer sales this year.

National Brewing Co. indicated that its ratios of cans and one-ways were approximately as follows. These ratios would not, of course, be representative of nationally adver-

tized brands, which are typically sold for the same retail price in cans as in one-way bottles.

	% of Total Packaged Beer Sales National Brewing Co.			
	1949	1950	1951	1952
Cans	17%	22%	16%	16%
One-Way Bottles	8%	10%	17%	20%

Indications have been given that in Baltimore proper the one-way bottle has been outselling the metal can by as much as 2 to 1 for *local brands*. Obviously, such a situation is a matter of concern to can manufacturers. The American Can Company has been sufficiently interested to have commissioned a research agency to conduct a pilot survey in Baltimore (copies of which have been presented to Baltimore brewers) seeking to determine factors influencing consumer preference for cans or one-way bottles for beer.

The survey found what was already fairly clear—that *price was a critical factor*—and observed that a 17-19¢ per case price differential (one-ways below cans) was passed on to the consumer in 2/3 of the stores included in the sample. However, even in outlets where the full price differential was not passed on, the one-way bottle was selling fairly well, presumably as a result of the intensive promotional campaign which began in 1949.

The consumer sample of the Amreican Can study indicated that women were not clear in their container preference but that men readily chose the one-way bottle because of the lower price. In their most recent purchases, interviewees named the one-way bottle over the can by a 2 to 1 ratio. However, under conditions of *equal price*, the consumer preference ratio reversed to nearly 2 to 1 in favor of cans. (For the U. S. as a whole the ratio, in favor of cans, is better than 4 to 1.)

[fol. 1202] Examples of the price structure in Baltimore in the early Fall of this year are as follows:

Typical Price Per Case of 24	Popular Brands (Gunther, National Bohemian, etc.)	Premium Brands (Schlitz, Budweiser, etc.)
Export Bottles		
Brewery	$1.85+dep.	
Wholesale	2.35+dep.	$3.45+dep.
Retail	2.69–2.79+dep.	4.01+dep.
Margin	.34–.44	.56
Margin as % of Retail	12.6%–15.8%	14.0%
Cans		
Brewery	2.44	3.04
Wholesale	2.87	3.69
Retail	3.28–3.40	4.16–4.40
Margin	.41–.53	.47–.71
Margin as % of Retail	12.5%–15.6%	11.3%–16.1%
One-Way Bottles		
Brewery	2.22	3.07
Wholesale	2.68	3.69
Retail	3.13–3.25	4.16–4.40
Margin	.45–.57	.47
Margin as % of Retail	14.4%–17.5%	11.3%

Note.—Wholesale prices include tax.

Retail prices, it will be noted, vary considerably according to the type of outlet and are not entirely comparable in the above table. Wholesale prices provide a more direct comparison and are a guide to the typical differentials according to package. For local, popular-priced brands one-way bottles are priced at 19¢ per case below cans, which would make the typical unit price at retail nearly 1¢ less. Returnable bottles including deposit of 48¢ are only 3¢ per case less than cans, which would make them sell typically at the same unit price in retail stores including 2¢ per bottle deposit. One-ways, therefore sell at a price advantage over cans and are only 1¢ per bottle more than the net price of returnables. For nationally advertized (premium) brands, the situation is, however, quite different. One-ways and cans are priced to sell at the *same price*, and both are 24¢ per case, or 1¢ per unit, *less* than the returnable bottle including deposit.

Although one-way bottles have not succeeded in gaining a comparable market position in any other important city or region, the Baltimore situation illustrates the kind of penetration possible where the following circumstances are uniquely favorable to one-way bottles:

[fol. 1203] (1) Local brewers, by their pricing, assure a price differential in favor of the one-way bottle of nearly 1¢ per package below the price of canned beer.

(2) Local brewers actively advertize and promote the one-way bottle—including advertising the lower price *at retail*, thus forcing the differential to be passed along.

(3) Cut-rate pricing is common in retail outlets.

(4) Consumers frequently purchase by the case.

(5) Sales in super-markets are a relatively unimportant part of total retail sales of packaged beer.

Of all the above factors, *price* is the most important, of course. Although total actual costs to the brewers, and to the trade, cannot be accurately determined, the 19¢ per case differential in favor of one-ways for local brands in Baltimore is an *artificial* one, judging by estimated container costs, and by the pricing patterns in other areas. Without allowing for savings in cans, resulting from higher filling speeds, lack of breakage, larger delivery loads and lower handling and storage costs; which would reduce the true cost differential between one-way bottles and cans, it is estimated that the actual difference in cost during the past season was only about 10 to 12¢ per case, as indicated below. Prices of containers, cartons, etc. will vary according to locality and according to types of cartons, labels, etc. actually used, but those below are fairly typical.

Comparison of Typical Prices to Brewers
Cans vs. One-Way Bottles
August 1952

	12 oz. GB-8 Bottle		Lithographed Can 12 oz., F.T., 4 Color	
	Price Per M	Price per Case	Price per M	Price per Case
Containers	.....	.....	$29.51	$.7082
Containers	$25.70	$.6170	.....	.....
Cartons			3.75	.0900
Lables	1.30	.0312	.....	.....
Crowns	1.81	.0433	.....	.....
Total	$28.81	$.6915	$33.26	$.7982
Difference, without 6-packs			4.45	.1067
Less: Estimated saving on 6-pack cartons*			3.33	.0800
Difference, if 6-packs are used			1.12	.0267

* Comparative prices for 6-pack cartons are $48 per M cartons for bottes, and $28 per M cartons for cans.

[fol. 1204] Since last summer, beer can prices have been increased slightly (nearly 3¢ per case) and a new one-way bottle, the G B-7, has been introduced, at a price of 10¢ per case below the old G B-8. The following table shows the comparative costs at the present time.

Comparative Prices of Cans vs. One-Way Bottles
January 1953

	12 oz. GB-7 Bottle		Lithographed Can 12 oz., F.T., 4 Color	
	Per M	Per Case	Per M	Per Case
Containers & Cartons	$21.50	$.5160	$34.43	$.8263
Labels	1.30	.0312	.....	.....
Crowns	1.91	.0458	.....	.....
Total	$24.71	$.5930	$34.43	$.8263
Difference, without 6-packs			9.72	.2333
Less: saving on 6-pack cartons			3.33	.0800
Difference, if 6-packs are used			6.39	.1533

The new G B-7's lower price is not expected to be passed along by Baltimore brewers, in which case the typical wholesale price differential of 19¢ per case for beer in one-way bottles versus beer in cans will be more nearly realistic in terms of costs to the brewer, and there is no longer the expectation that competitive pressures might in time substantially reduce the artificial differential which has been in effect. Thus, it is not to be expected that the competitive position of the can—for local brewers—will improve very significantly, as long as the local brewers continue active promotion of the one-way bottles.

This study has, however, proved to be enlightening as an indication of the significance of price as a factor in the package preference of consumers. In this regard the new G B-7 bottle becomes a potential threat to the beer can which cannot be lightly dismissed, since it reduces the cost of a bottle of beer by nearly ½ cent (10¢ per case). If this differential is passed along in market areas (New York Metropolitan Area, for example) where the one-way bottle has failed to catch on, it might well bolster the competitive position of the one-way bottle enough to cut significantly into potential can volume. For this reason, we plan considerably more study on the future competitive position of the can as a package for beer, particularly as affected by prices and pricing structures in various markets.

[fol. 1205] It may well be that a new promotional effort will be needed to help offset the lower cost of one-way bottles, but that remains to be considered after the possibilities of the new G B-7 have been adequately tested.

[fol. 1208] A Comprehensive National Study of Consumer Preferences for Different Types of Beer Containers

Purpose and Method

The purpose of this study was to provide a complete and detailed analysis of consumer preferences for different types of beer containers with the aim of developing information in two basic categories:

1. To attempt to uncover information which will aid Continental Can Company to show Brewers that the use of cans is advantageous in the merchandising of beer.
2. To compile a mass of descriptive and explanatory information covering the general market picture for the various beer containers: the extent of use, drinking and buying habits, and consumers attitudes and reactions towards cans versus bottles for beer.

To achieve these dual objectives, the study was necessarily comprehensive in nature going into all of the ramifications of the use of and the preferences for the various beer containers.

The study was conducted among a cross-section of beer drinkers on the basis of a national sample representing all cities and towns of 1,000 population and over. All results are based on personal interviews conducted in the respondents' homes.

In total 4166 adults were interviewed throughout the [fol. 1209] country, of which 1823 were found to be beer drinkers in accordance with the definition established—"those who drank some packaged beer within the last two weeks preceding the interview." This definition was established to eliminate the sporadic or very occasional drinker whose views on the subject would not be sufficiently crystallized.

In addition to developing the picture for the country as a whole it was desired to have some of the basic information broken down separately for the four major geographic areas of the country—East, South, Mid-West, and Far

West. To insure a sample of sufficient size for these area breakdowns it was necessary to assign approximately twice as many interviews in the Far West as would have been necessary for proper representation. In order to maintain a correctly proportionate sample for the country as a whole, in all tabulations shown for the total country the interviews in the East, South, and Mid-West were given double weight in tabulation. In this manner the proportion geographic balance was established while utilizing all interviews actually conducted. Naturally, these weights were removed for tabulations broken down separately for each area. The table below shows for each geographic area, the actual number of interviews conducted including drinkers and non-drinkers, the number after weighting, and the actual percentage distribution of the population.

	Actual number of interviews conducted		Number of interviews after weighting		Actual percentage distribution of the population

Retail Level Study of New Quart Beer Can Acceptance in Chicago

Commercial Research Department
February 21, 1956

[fol. 1211] #43—Head Office

Mr. C. H. Buckley

February 21, 1956.

Retail Level Study of New Quart Beer Can Acceptance in Chicago

As you know, Mr. Walter Way spent a week recently in Chicago to study the movement of this new container at the retail level. Chicago was picked because this market was the first in which the new American quart can achieved widespread distribution under the Pabst label. Working with Mr. Way in contacting a large representative group of beer outlets were two Central Division sales trainees. Among them they covered about 250 outlets in all parts of the City.

Mr. Way found that generally, although distribution secured by Pabst has been widespread in Chicago, their label is not an extremely heavy mover in quarts and inasmuch as a great deal of the volume movement has replaced Pabst glass quarts, the over-all level of sales for the new container is not high. However, the impression was gained that this new container, when attractively priced about equal to the throw away bottles, met with consumer acceptance and should brands having large shares of particular markets be sold in such a container, heavy movement could be expected.

Further copies of this report are available.

[fol. 1212] Retail Level Study of New Quart Beer Can Acceptance in Chicago

During the week of January 23-27, a survey was conducted in Chicago to determine how well the new Pabst quart beer can was moving, and to measure consumer and dealer reaction to the new package.

Conclusions

Several conclusions were reached as a result of the information obtained from the survey. Although the quart can has not yet done too well in Chicago, there were strong indications that the consumer would eventually accept the package—especially in the summer. Thus far, in those areas where the can has moved well, it has been at the expense of quart bottles rather than smaller sized packages. The can will be unable to make inroads with price conscious consumers, as they generally buy local beers in returnable bottles because of the cost savings. The retailer generally favors the quart can, but as a replacement for quart bottles. There will be resistance to stocking any more packages. For the most part, brand loyalty was found to be significant, and only a few consumers switched brands to get the quart can. Most retailers wanted to see other brands in the quart can, and felt that the package would move faster with brands more popular with their customers. The can itself was quite acceptable, although many consumers didn't like the pouring feature. Some found that the beer went flat when recapped, and some difficulty in opening was encountered, although reaction to the opening feature was favorable. The stacking feature was unimportant, both because of the widespread use of the paper [fol. 1213] two-pak and also the lack of mass displays.

Method of Conducting Survey

In order to set up the survey, a complete listing of the nearly 9,000 liquor outlets in the City of Chicago was obtained, complete with addresses. Taverns and night clubs selling for on-premise consumption only were eliminated, along with most miscellaneous package stores, including drug and grocery stores. Of the more than 2,000 outlets remaining, about 140 were package liquor stores, while the rest were combination tavern and package stores. These outlets formed the basis of the survey. The city was divided into more than fifty small areas, in order to obtain a fairly reliable cross section of the City of Chicago. Some outlets in each of as many of these areas as possible were chosen for the survey, with the result that the sample obtained precludes the possibility of being heavily weighted

by any single section. More than 200 completed questionnaires were obtained, with several others omitted because of lack of information.

Detailed Findings

There is little question as to the fact that Pabst has obtained good distribution with their quart can. Only about one in every ten outlets was not carrying the package, and some of those had had it, and dropped it. In several places where the can had been stocked, the dealer had dropped the Pabst quart bottle because he did not wish to carry additional packages for one brand in a single size.

[fol. 1214] There was great variation in the price of Pabst's quart can, although it was generally priced at 45¢-47¢. In some places it sold for as much as 50¢, while one store was still working on a "deal", and was selling it for 39¢. For the most part, the price was virtually the same as premium one-way quart bottles, and from 2¢ to 5¢ above the cost of the premium returnable bottle without deposit. About two out of every five outlets carried only returnable or one-way premium quart bottles, but not both. Very few stores carried the same brand in both the one-way and returnable bottles. In several instances, all three quart packages were selling at the same price, with the returnable bottle having an extra nickel added on for deposit. In these cases, the can was moving quite well, but the dealer complained that with such a price structure, he made less profit on the can than on the other packages.

In some areas price has had a definite influence on the poor showing of the new can, although in those areas where it made a real difference, premium beers made no headway against the low priced local brands. For the most part, local brands in returnable bottles sold for 10¢ below the premium beer in the same container, although the differential was as high as 14¢ in some places, and as low as 7¢ in others. There was one local brand (Prima) which was selling well below the other Chicago beers—occasionally as low as 23¢.

[fol. 1215] Several dealers felt that this was a bad time to introduce a new convenience package, as their beer business was at a seasonal low. Many expressed the opinion

that when hot weather came, it would move very well. Dealers also expressed the opinion that one reason the package was not moving was the low popularity of Pabst with their customers. They felt that brand loyalty was strong in their area, and that more popular brands would move well in a quart can. The dealers themselves were generally in favor of the quart can. However, they would want to see it replace the quart bottles entirely, and they don't want to take on additional packages. On the other hand, several dealers wanted no part of cans, as they felt that the returnable bottles brought their customers back.

The can utilized by Pabst drew several comments during the course of the survey. Nearly all the advantages inherent in any can were mentioned frequently, i.e., easier to handle, eliminates deposits, chills easier, stays cold longer, no breakage, takes less storage space, etc. In addition, the snap cap and the opening feature drew quite a lot of favorable comment, although there were a few instances where the dealer said that his customers complained that the can didn't open as advertised. The largest complaint against the can was the pouring feature. It was stated that when you poured slowly, the beer dribbled down the side of the can, and when you poured fast, you either completely overshot the glass or else got so much foam that you couldn't get at the beer. Metallic taste was brought [fol. 1216] up a few times, and in some cases the taste was reported as just being different than that of bottled beer. Several dealers reported their customers as saying that the snap cap was fine, but that the beer went flat when the cap was replaced. A few voiced complaints about leakers, but these came from only a very small percentage of the outlets carrying the can. The stacking feature came in for only a small amount of comment, as most of the outlets visited kept their beer refrigerated, and didn't have room to make displays. When mass displays were built, the two can cartons were used, thus minimizing the advantage of a stacking feature, since any can will stack in cartons.

In those areas where the quart can was moving quite well, it seemed to be almost entirely at the expense of quart bottles, and for the most part, Pabst quart bottles. In these

areas, repeat business was reported, but generally from old Pabst drinkers from way back. Several dealers expressed the belief that a more popular brand (Schlitz was mentioned several times) would move much better, and probably at the expense of other brands.

Carbonyl Compounds in Schlitz Beer (Test Pack C659)

To Determine the Volatile Carbonyl Content of Schlitz Beer

Report

3202-015-57
3202-010-57

Introduction

The problem of beer stability in cans was presented to the Packaging Engineering and Container Research groups in May, 1957 [1]. It was stated that beer in cans had about half the shelf life of beer in bottles. Container Research was charged with the responsibility of making fundamental studies of beer in the hope of isolating the causative agents of these flavor changes; it was anticipated that once these flavor changing factors were known, it would be possible to relate them to specific components of the beer can, thereby making it possible to make corrective changes in the beer can if such were necessary.

On the basis of a literature survey and trips to Milwaukee [2] and Madison [3] to consult with workers in the field of beer chemistry, it was decided that changes occurring in the volatile carbonyl compounds of beer on storage represented a logical area of investigation.

A test pack of Schlitz beer was made in Milwaukee at the Joseph Schlitz brewery on July 16, 1957. Beer from the same government cellar was used in both bottles and cans, and 25 cases of each variable were packed in this fashion. These cans were stored at 40°F., 70°F., and 100°F. This beer was used for this investigation.

Conclusions

The carbonyl content of the volatile fractions of Schlitz Beer packed in bottles and cans and stored for three months at 40°F. was practically identical. This determination was made by preparing the dinitrophenylhydrazones of these carbonyl compounds and weighing them.

The weight of the dinitrophenylhydrazone derivatives obtained from bottles and cans stored at 100°F. was also practically identical. However, the level at 100°F. was slightly lower (by about 8 mg.) than that at 40°F., indicating that at the higher storage temperature there was some loss of volatile carbonyl content.

An analytical determination of the acetaldehyde content of this beer and a conversion of this value to dinitrophenylhydrazone derivative showed the calculated value to be very close to the gravimetrically derived value. This suggests strongly that the major constituent of the volatile fraction is acetaldehyde.

Acetaldehyde and dinitrophenylhydrazone determinations on Blatz beer stored for two years at 70°F. yielded only trace amount of these materials, suggesting that volatile carbonyl components tend to diminish on storage.

The Beverage Section flavor test panel was able to detect a flavor difference between cans and bottles at the three month storage level (40°F.) but as indicated from the volatile carbonyl content described above, it was not possible to establish any correlation between flavor changes and carbonyl content.

Recommendations

Since the data collected in this experiment suggest that volatile carbonyl compounds are not involved in flavor changes occurring in bottled and canned beer, it is recommended that additional investigations be directed to other [fol. 1218] fractions of the beer.

For example, it may be possible to separate whole beer into several fractions by column chromatography, using such adsorbents as carboxymethylcellulose. An attempt can then be made to characterize these fractions by paper electrophoresis. Beer from the same government cellar packed in bottles and cans should be used for these investigations.

Lyophilization (freeze drying) is another investigative

technique that may be followed. Beer can be lyophilized, and the volatile fractions can be separated and identified by various chromatographic techniques. The non-volatile fraction of lyophilized beer containing the nitrogenous components can then be investigated by paper electrophoresis techniques.

It is also recommended that further investigations along organoleptic lines be considered. For example, the volatile fractions of canned and bottled beer can be collected and concentrated; small portions of this concentrate can then be added to distilled water and to fresh beer to see if the original flavor can be detected again. The same procedure can be applied to the non-volatile fraction. If the sources of "canned" and "bottled" beer flavor can be isolated by this technique, then the originating fractions can be intensively investigated via chromatography, electrophoresis, infrared, or other modern investigative techniques in an attempt to isolate and identify the flavor causing agents.

Procedure

Complete details of the investigation made on the volatile carbonyl fraction of Schlitz beer pack C659 can be found in data book pages L604-17 and L640-46 appended to this report.[8] These details can be summarized briefly as follows: an attempt to separate the volatile carbonyl fraction via vacuum distillation at room temperature into acidified 2,4 dinitrophenylhydrazine was unsuccessful as no dinitrophenylhydrazone precipitate appeared in the distillate; the immersion of the distilling flask into a water bath at 130-140°F. also yielded negative results. Air was used to sweep the volatile fraction over into the distillate. Some contamination of the distillate resulted due to bumping and frothing of the product during the distillation.

A crystalline dinitrophenylhydrazone precipitate was formed when beer was distilled at 180-212°F. and atmospheric pressure, but when vacuum distillation was attempted in order to lower the temperature of distillation, there was excessive carryover of beer into the distillate caused by bumping and frothing and, hence, this procedure was abandoned.

It was finally decided to use distillation at atmospheric pressure and 180-212°F. temperatures; nitrogen gas was

used to sweep the volatiles into the acidified 2,4 dinitrophenylhydrazine in the receiving flask. Three bottles and three cans at 40°F. storage and 100°F. storage were treated in this fashion and the dinitrophenylhydrazones from each group of three variables were concentrated in one receiver. These receiving flasks were put away for several weeks in the dark at room temperature while efforts were concentrated on the determination of acetaldehyde and acrolein.

Emphasis on the determination of these two aldehydes was made when uncertainties arose as to the further treatment of the dinitrophenylhydrazones collected as described above. It was originally intended that a simple gravimetric determination of dinitrophenylhydrazone would be [fol. 1219] made of beer at various storage levels in bottles and cans to see if the dinitrophenylhydrazone content would be related to storage temperature and container variable. However, Dr. R. E. Henry indicated that a chromatographic separation of dinitrophenylhydrazones would be necessary in order to identify them and that this would be a long and tedious procedure. Other literature sources [5] indicated that the acetaldehyde and acrolein were important volatile substances contributing to odor and flavor; simple colorimetric procedures for their identification were described. Consequently, it was decided to make these identifications in this Schlitz beer pack, and from the results obtained, decide whether or not the more elaborate chromatographic procedures would be warranted.

The investigations of the acetaldehyde and acrolein content of Schlitz beer pack C659 are described in pages L618-39 appended to this report.[7] It can be seen that no acrolein was found, and the acetaldehyde found was approximately the same in both bottles and cans at 40°F. and at 100°F. For example, after three months storage at 40°F., the acetaldehyde level was approximately 6 ppm in both bottles and cans; at 100°F. it was approximately 5 ppm. Thus, there was a 1 ppm difference between the two storage levels but no difference in the bottles and cans at each temperature, and thus the acetaldehyde content was independent of the container variable employed.

The acetaldehyde content was also determined in several other beers. For example, in Braumeister beer pack C755 where beer from the same government cellar was packed into both bottles and cans in a fashion similar to

Schlitz pack C659, the acetaldehyde level in both bottles and cans after two months storage at 70°F. was approximatel 4.5 ppm. Again there was no difference which could be traced to an effect due to the container variable employed.

Since no further matched bottle versus can packs were available for acetaldehyde determinations, several other packs were used to develop further information on acetaldehyde content. For instance, Blatz beer in bottles stored for three months at 40°F. yielded a value of 6.7 ppm. Two year old Blatz beer stored in cans at 70°F. had an acetaldehyde content of 2.6 ppm. This seems to indicate that the acetaldehyde level decreases with storage.

It was now decided to go back and make gravimetric determinations on the dinitrophenylhydrazone precipitates obtained from Schlitz beer C659. In this connection, an article in the literature [6] indicated that from 95 to 100% of aldehydes in an aqueous solution could be recovered by precipitating them as dinitrophenylhydrazones. These gravimetric determinations were then made, and when the acetaldehyde values were converted to their theoretical dinitrophenylhydrazones and the values were compared to the gravimetric figures, there was very close agreement between the two sets of data, indicating that the volatile carbonyl fraction of Schlitz beer consisted for the most part of acetaldehyde. The figures are summarized below. (See pp. L644-45 for further details)

		Gravimetric	Theoretical
Schlitz bottles	—3 months at 40° F.	33.2 mg.	32.0 mg.
Schlitz cans	—3 months at 40° F.	31.5 mg.	32.1 mg.
Schlitz bottles	—3 months at 100° F.	26.5 mg.	25.8 mg.
Schlitz cans	—3 months at 100° F.	25.7 mg.	25.8 mg.

The flavor panel in the Beverage Section had been able to detect a flavor difference between these bottles and cans [fol. 1220] stored at 40°F. At 100°F., the beer had deteriorated badly after three months in both bottles and cans, making it impossible to make this differentiation. However, it can be seen at the 40°F. level that the acetaldehyde determination yielded no clue as to the flavor difference found.

Packaged Beer Trends

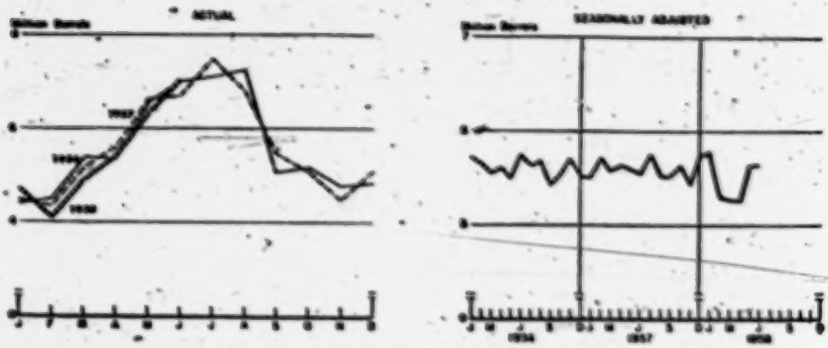
Continental Can Company

June Packaged Sales Soar

After four poor monthly showings in a row, packaged beer sales of 7 million barrels in June were more than 350,000 barrels or 5.3% above June, 1957. Total beer withdrawals enjoyed a 4% increase. The good monthly showing reflected the number of brewers which set company records for the month. For the first half, packaged sales were down .9%. Total beer sales were down slightly more —1%—as the draught variety slipped 1.7%.

Packaged beer as a percent of total beer set a new high in June. The 81.7% level was one full point better than June, 1957. This brought the six month ratio up to 79.6% for a gain of .1 of a point.

SALES OF PACKAGED BEER



One-way containers (up 20.2%) enjoyed all of the monthly growth as the returnable bottle continued to decline (down 5.0%). Can shipments alone rose 21.8% with part of this big gain being artificial as last-year's goal was abnormally low in the wake of forward buying. One-way bottle shipments moved up 10.0%. Cans represented 42.1% of all packaged and one-way bottles 6.3% for gains of 5.7 points and .3 of a point respectively.

To date, can shipments were up 1.2% with one-way bottles registering a .9% plus. Returnable bottles declined 2.4%. Cans increased their share of the packaged market by .8 of a point to 38.1% and one-way bottles gained .1 of a point to 5.5%.

Beer Can Shipments

Sales Analysis Department

Packaged beer sales during January were 12.5% above January 1951 while total sales showed only a 9.3% increase.

Industry beer can shipments during January totaled approximately 281 million units which was 20.4% or 72 million units below the activity level of January 1951. In contrast to the decline in can shipments which resulted from Government restrictions, January non-returnable bottle shipments increased 162.9% or approximately 58 million units over January last year.

Continental's beer can shipments during January totaled 113 million units which was 10.5% below January 1951 shipments. Continental's share of total beer can sales was 40.3% during January as compared with 35.9% during the same month last year.

Beer Trends July 9, 1948.

Commercial Research Department

The Overall Outlook—Both beer production and taxpaid sales experienced a setback during the month of May, failing to equal comparative last month and year ago figures. Unseasonal weather has been the major contributing factor, but rumors of overstocking of some distributors and retailers, as distribution pipelines gave evidence of being filled, provided some indication that current consumption ceilings were being approached.

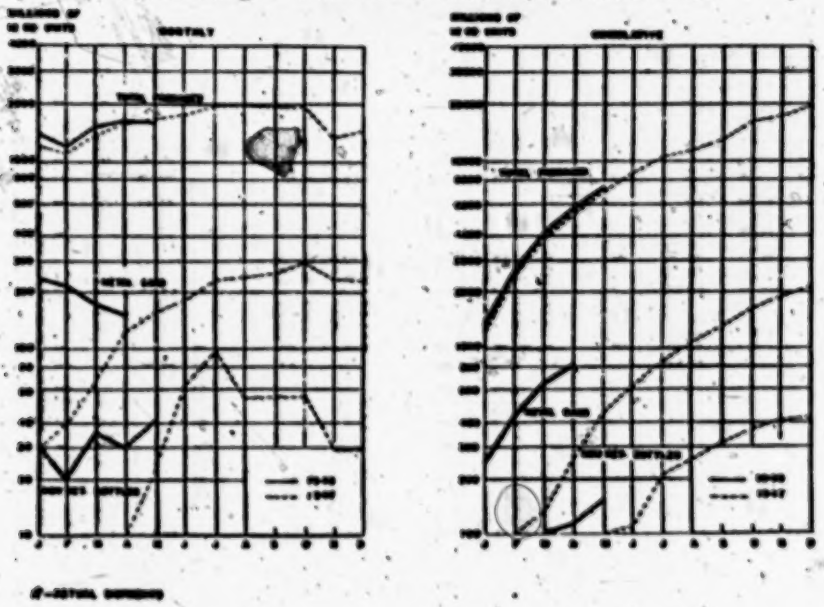
Packaged Beer Sales Total packaged withdrawals during May were 8.6% below the same month last year. However, for the 5 months to date packaged sales are 1.5% better than they were in 1947.

Non-returnable bottle shipments in May hit their peak month for this year and with a similar anticipated increase in can shipments the returnable bottle has been the package most affected by this month's sales lag.

PACKAGED BEER SALES

1948 vs. 1947

Total Packages—Metal Cans—Non-Returnable Bottles



[fol. 1227] *Beer Can Shipments* Indications from Continental's May figures (Industry not yet available) are that the steady decline of beer can shipments since the first of the year has been reversed. Heavy off-season purchasing of cans in anticipation of allocations has been brought to an end, and shipments should now follow a more normal seasonal pattern.

Beer Sales and Production

Monthly and To-Date—April 30, 1948

The following are the latest Treasury Department releases covering beer production and taxpaid beer sales for the month of April 1948 as compared with the same month of 1947, also four months to date comparisons 1948 vs. 1947.

April production was 7,380,653 barrels, which was .7 percent less than April 1947 and 5.6 percent more than March 1948. Taxpaid sales for April were 6,976,591 barrels which was .7 percent less than April 1947 and 4.1 percent more than March 1948.

Taxpaid packaged sales for April 1948 were 4,735,261 barrels or .5 percent more than April 1947 and 3.9 percent more than March 1948. For the four month period ending April 30, 1948 packaged sales were 17,149,486 barrels, or 4.6 percent more than the same period 1947.

While beer production and taxpaid sales for the month of April were lower than for the same month last year, the decrease was slight and does not materially affect the yearly trend. Both continue on approximately the same high level as during 1947.

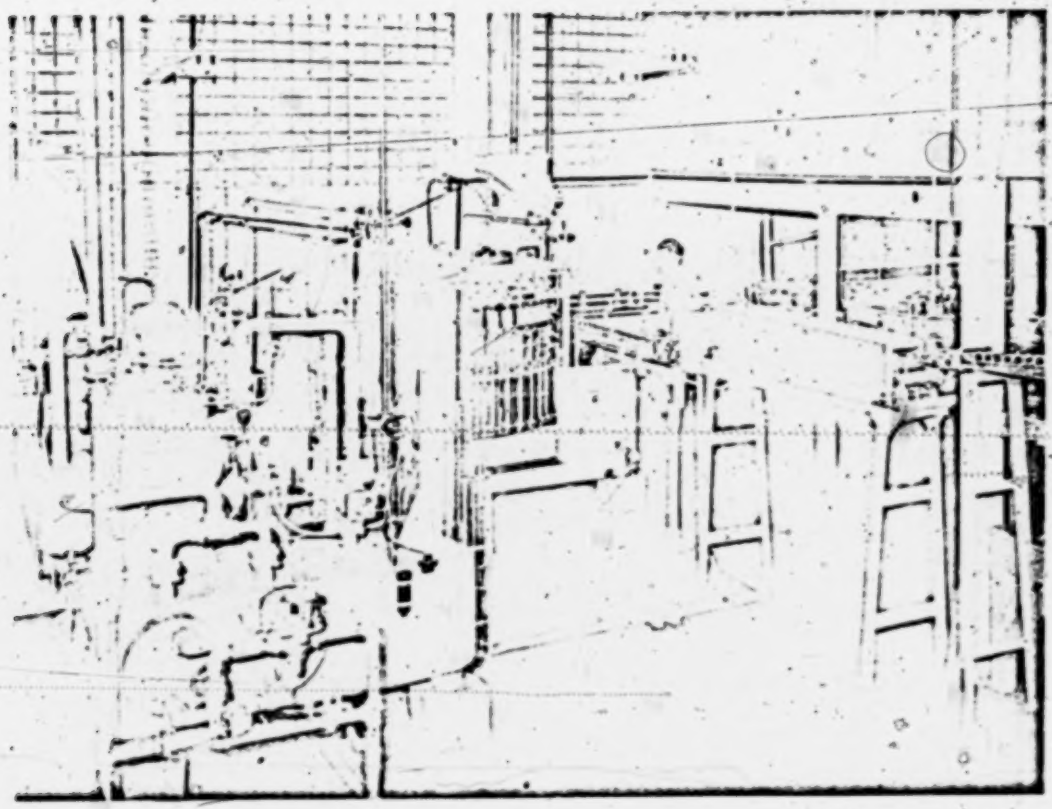
The ABC's of canning soft drinks

"Soft drinks in cans—what does this new development mean to me?" That question has been asked of Continental by many people in the soft drink industry.

There is no one answer that applies to every soft drink packer. Cans, as a package for soft drinks, have gained acceptance in many markets because of the convenience they offer to packer, retailers, and consumers. On the other hand, certain technical and economic problems must be considered before adopting the new package.

We hope that this booklet will answer some of your questions, and help you to decide where cans belong in your operation. If you wish to explore the subject further, there is a Continental representative near you. He will be happy to discuss your particular problems with you at any time.

One of the original soft drink canning plants.



Development of the soft drink can

The soft drink can has been generally available for only a short time, but the idea of a can for this group of products is not new.

In 1935, Continental Can Company started development work on a metal container especially designed for soft drinks. Some years later, an attempt was made to package carbonated beverages in cans. This project ran up against the first big hurdle in the path of canned soft drinks – it proved impossible with materials and techniques then known, to provide a can with adequate "shelf life" for soft drinks.

Another attempt was made in 1950. This time a much improved can showed promise of providing adequate shelf life, and was marketed with some success. However, restrictions of the Korean war and economic conditions made it hard for any disposable package to compete with returnable bottles. This situation curtailed plans for expansion; only one soft drink canning plant remained in operation.

By 1953, the circumstances had changed. Consumers were accustomed to products packaged for convenience in handling and use. Supermarkets, much expanded since World War II, were selling more and more soft drinks; the problem of handling deposits and empties was proving a costly one for them.

Recognizing this opportunity, one enterprising concern reintroduced soft drinks in cap sealed cans. Others followed in the flat top style. Canned soft drinks were given a good reception by consumers, and aroused much interest throughout the bottling industry. This year, of course, as more cans have become available and market demand has increased, many soft drink brands have entered the canning field.

What are the chances of continued, and increasing, success for canned soft drinks? We think that they are favourable. Public demand among the take-home trade for the convenience features of the can is established. Many retail outlets are enthusiastic about handling soft drinks in cans. Cans themselves are available in adequate quantities. Technical improvements have been made in can structure, linings, and manufacturing methods. Continuing research promises further progress along these lines.

Container requirements

A package for soft drinks must meet certain specific requirements. The container should be made of materials capable of holding the product under considerable pressure. Yet these materials must not affect the wholesomeness or flavor of the beverage. The container should be light in weight, but able to withstand comparatively rough handling during packaging and shipment. It must be a sanitary container that can be filled easily and sealed faultlessly at a high rate of speed. It should be an economical method of packaging soft drinks.

Types and sizes of soft drink cans

Two types of cans are presently being used for packaging soft drinks: cap sealed and flat top cans. The cap sealed can with a cone top and crown closure is somewhat similar to the soft drink bottle; the flat top can is much like the present beer can.

Cap sealed cans for soft drinks are made in 6-, 12-, and 32-ounce sizes. The flat top style is available in the 12-ounce size for carbonated products, and in several sizes for still drinks.

Can-making materials

To produce a container which will protect the quality of soft drink products, the can manufacturer must make judicious selection and use of can-making materials. The soft drink can is made of the best tin-coated steel plate available.

The cans and ends are lined on the inside with two or more coats of can-lining materials to guard the taste, appearance and wholesomeness of the contents. The first coat is usually applied in the flat before the can body is formed. The second coat is applied after the can has been fabricated. These materials are carefully selected to make sure that they do not impart any off-flavor to the particular beverage being packaged in the can.

A decorative label (in the design and colors selected by the packer) is lithographed on the outside of the can by the can manufacturer, thus eliminating the labeling operation in the packer's plant. The exterior of the can and ends are further protected by one or more applications of a protective material.

Can structure

Carbonated beverage cans must withstand the maximum internal pressure developed by the product during storage. This internal pressure may be as high as 140 pounds per square inch, corresponding to five volumes of carbonation at 110°F.

To meet these requirements, the side seam and ends of the can must perform satisfactorily under the maximum pressure conditions anticipated. Side seams having outside soldered tabs were designed specifically for use on carbonated beverage cans. Types of side seams used increase the overall strength of the container and prevent the seam from opening, even under critical storage conditions.

Sealing the container

Another major requirement of a container for soft drinks is that it must be able to be filled easily and sealed faultlessly at a high rate of speed.

The cap sealed can and the bottle are crowned in a similar manner, on the same kind of machinery, and with approximately equal efficiency.

The flat top can is closed in an entirely different manner; a closing machine is employed to attach the covers to the cans. This is done by means of a double seam made air-tight by the use of a sealing material.

Other qualities of the soft drink can

In addition to meeting specific requirements, the metal container possesses many qualities considered advantageous for a package for soft drinks.

Soft drink cans stack easily and may be stored in a minimum amount of space — whether it be in the packer's warehouse, in transit, on the retailer's shelves or in the consumer's refrigerator.

The cans are also light in weight, effecting a considerable saving in distribution costs.

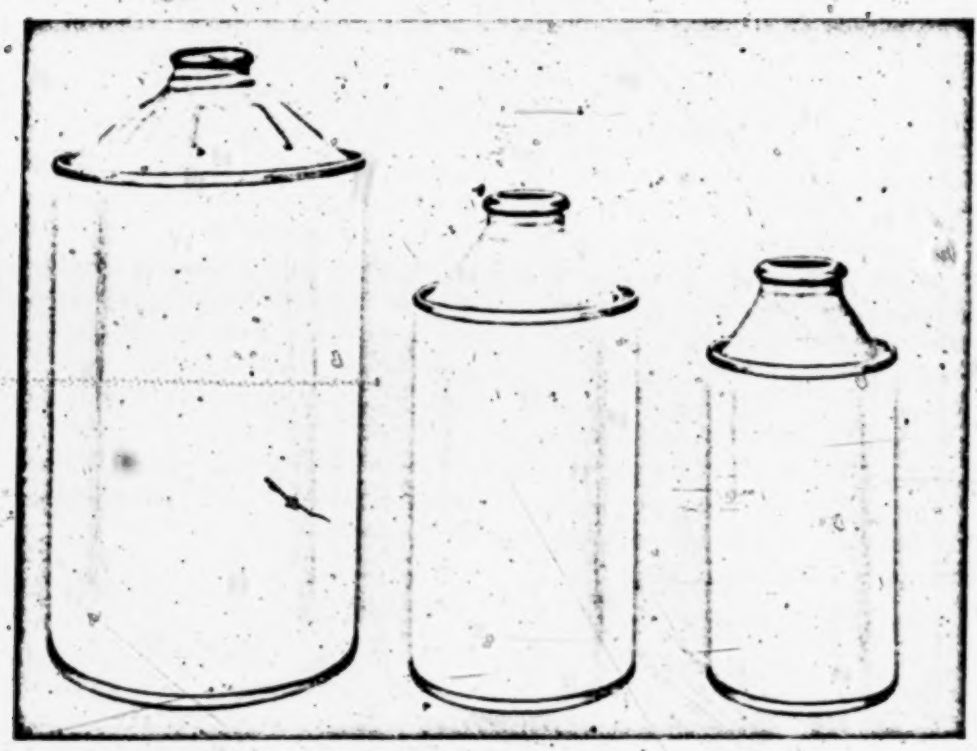
The lithographed can is colorful and lends itself to the most attractive shelf display.

Sturdy and easy to handle, it will not break even under extremely rough handling.

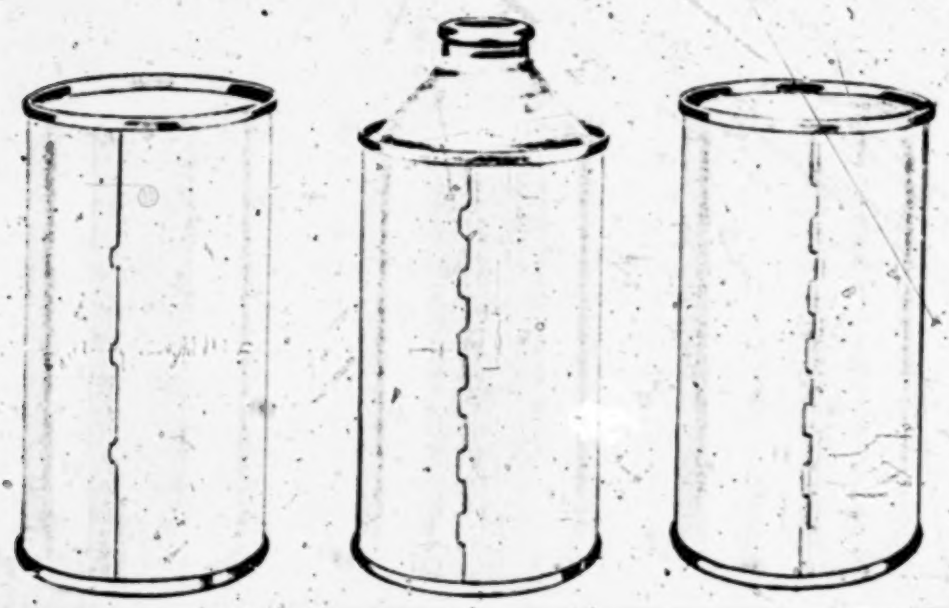
There are no deposits or handling of "empties" by the retailer. The soft drink can is used once and then thrown away.

In addition, the can offers the consumer many convenience factors. It chills rapidly in the refrigerator, eliminates storage and subsequent return of "empties" to the retailer.

Three sizes of Cap Sealed cans — 32, 12, and 6 ounce.



Side seams for carbonated beverage cans must be specially designed to resist internal pressures.



[fol. 1240]

Economics of soft drinks in cans

The consumer advantages of the can for soft drinks command a premium retail price in most markets, offsetting the slightly higher costs of this package. Prospective canners should investigate all cost factors to evaluate profitable use of the metal package in their market.

Costs will vary in every case, and "typical" comparisons are often misleading. The following factors should be considered in each individual cost analysis.

Containers – While returnable bottles are less expensive than cans or throw-away bottles, care should be taken to include an adequate allowance for replacement and obsolescence. Cans normally cost about 3¼ cents each for either style, compared to 2¾ to 3 cents each for one-way 12 ounce bottles.

Crowns – All packages except flat top cans use crown closures.

Labels – Labels must be included in analyzing bottle costs when color-applied labels are not used. Cans are lithographed and do not require labels.

Cases – Cost of cases will vary with style used. Returnable wooden cases are normally used with returnable containers. These cases are expensive initially, and require maintenance; however, being returnable, the cost can be spread over several trips.

One-way reshipping cartons are usually used to deliver cans and one-way bottles to the packer, and to carry the filled containers to the retailer.

Contents – There is no significant difference between the cost of ingredients for 12 ounces of a canned product and the same quantity packed in other types of containers.

Filling and packaging – Filling and packaging costs will depend upon the speed of each filling line, the number of people employed, and prevailing wage rates. In this respect, cans usually cost less. Sorting, washing, and inspection of returned empties is avoided. Can lines often operate at considerably higher speeds, allowing more output per employee.

Storage and handling – Empty and filled, cans are lighter and take less space. Thus, handling and warehousing costs will favor cans. Cans may be ordered as needed. There is no necessity to store large quantities of "empties" during the off-season.

Distribution – When store-door deliveries are made, cans normally prove easier (and therefore less costly) to

handle, since they are lighter and take less space. More cans may be placed on a single truck.

There is no need to sort, pick-up, or refund deposits for empties. Thus, each stop takes the driver less time.

The no-return feature of cans permits the central warehouse deliveries desired by many grocery chains. This method of distribution is low in cost, as many cases are delivered at a single point.

When shipping long distances, the weight and space-saving features of cans reduce the freight bill considerably.

Retailing – Cans require less shelf space and may be stacked more easily. Thus, they prove easier for the retailer to store and handle.

Cans need not be re-handled as empties.

To achieve an equal net profit, most large retailers state that a smaller gross markup is acceptable when selling soft drinks in cans.

Investment required – Syrup room, water treating equipment, and many other facilities of a normal bottling plant are equally suitable for canning. Filling and closing equipment, however, must be replaced or converted if cans are to be substituted for or alternated with bottles.

Approximate costs for typical installations are about as follows:

	New Filling Line	Conversion from Bottle Line
Glass Bottle line	$160,000	—
Flat Top Can line	130,000	$90,000
Cap Sealed Can line	100,000	20,000

Exact costs will of course depend upon equipment at hand, plant layout, and other factors. The above figures are intended only to be a general indication of outlay involved.

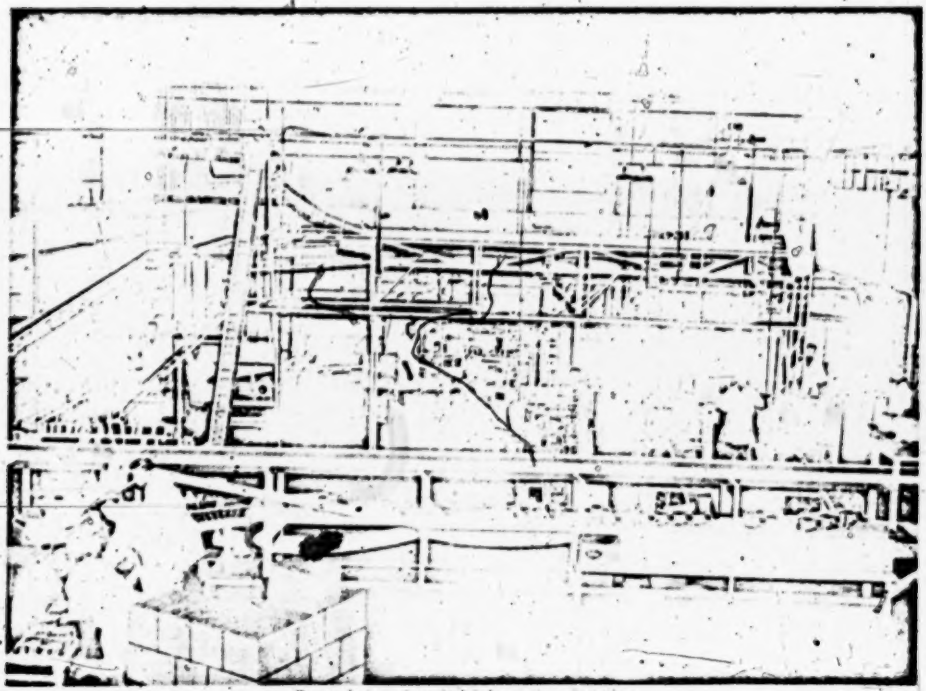
Amortization of the investment made is properly figured as a cost in analyzing various packages.

Total cost, retail price, and market – Each of the above factors contributes to the total cost chargeable to each type of package. Together with an allowance for overhead and profit for packer and distributor, these costs establish a logical retail price at which the product should be sold.

Canning procedures

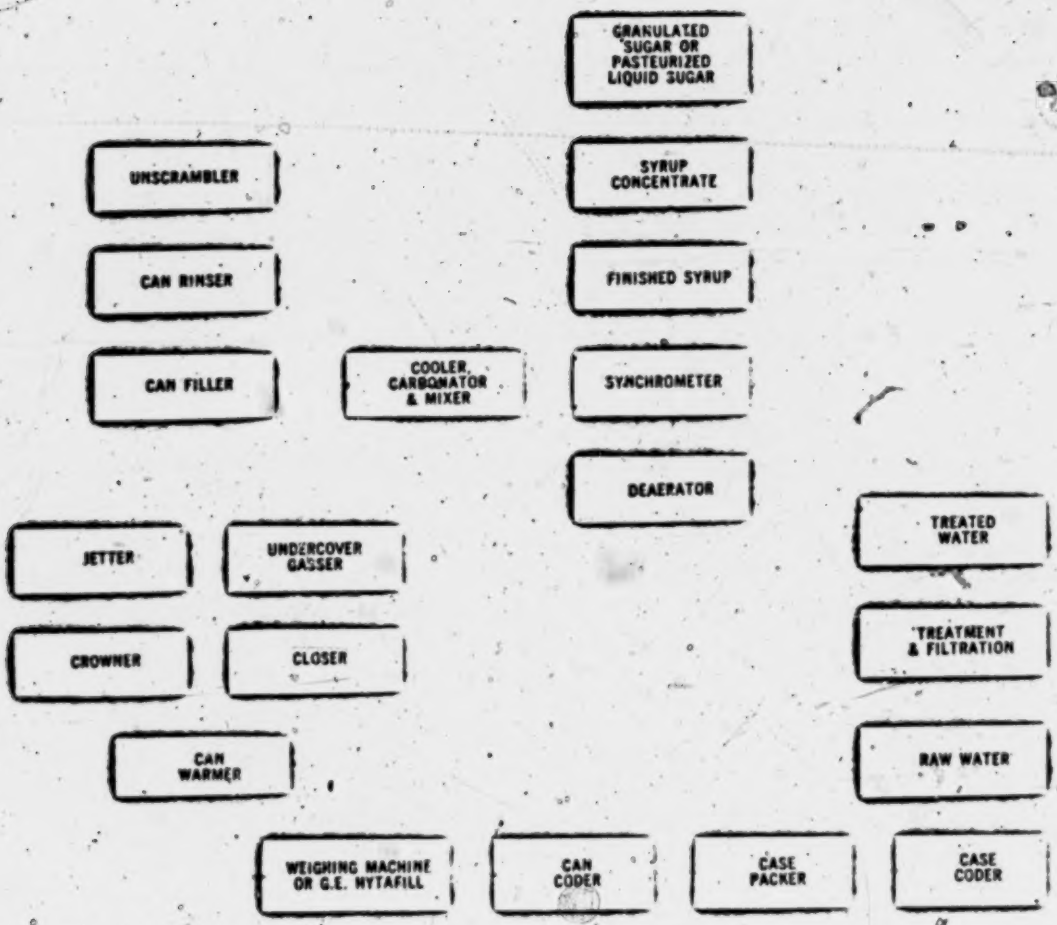
The techniques of canning and bottling soft drinks are quite similar. Therefore, the adoption of cans by the beverage industry presents few new problems as far as preparation and handling of the product are concerned.

The product for canning may be pre-mixed, or made by syruping and then adding carbonated water – the way most soft drinks are prepared today. The equipment used in the pre-mix or syruping systems of product preparation for bottling can also be used in canning. Thus, it is possible for a bottler – converting to cans or packing alternately in cans and bottles – to use his present water-treating, syrup-making, cooling and carbonating equip-



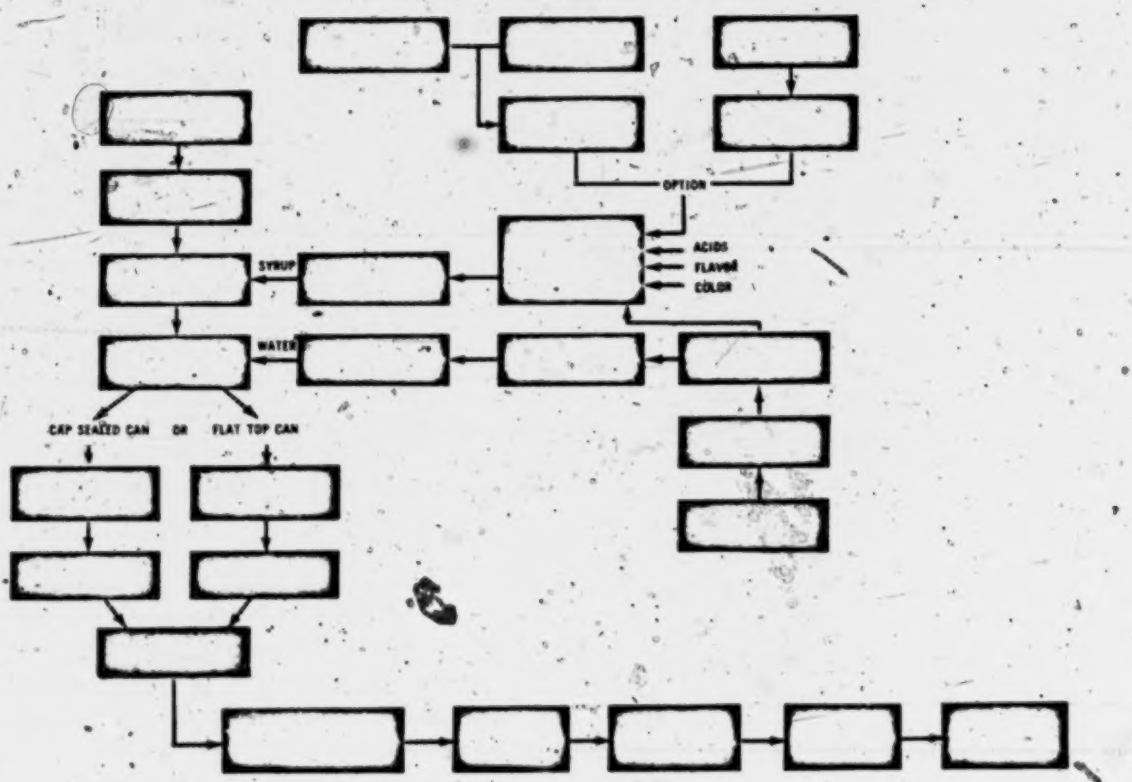
General view of a soft drink canning operation.

[fol. 1243] 2772



[fol. 1244]

Typical beverage canning line – syruping system



ment. When packaging the beverage in the cap sealed can, the bottler can even use the same filling and crowning machinery.

The principal differences between the bottling and canning operations lie in the handling of the containers before and after filling. Cans for carbonated beverages are usually received in re-shipper cases. Cans go first to the can unscrambler which orients the cans for conveying through the rest of the equipment. (Empty cases are belt-conveyed to the case packer.)

Since cans are not re-used, bottle soakers, washers, etc. are not required. However, prior to filling, the cans are spray rinsed. While being conveyed to the filler, the washed cans then make a series of twists and turns to facilitate drainage of wash water.

Syruping equipment and fillers are essentially the same for both bottles and cans, although special modifications may be necessary to adapt existing equipment to handle flat top cans. As in bottling operations, a specific amount of syrup is placed in the can and carbonated water is added on top of the syrup, by the filler.

Precautions must be taken to minimize the amount of air dissolved in the product. Excessive air content may have a harmful effect on the product and may also lead to reduced shelf life. On the cap sealed line, as the cans leave the filler a "jetter" injects a small amount of CO_2 or product into the top of the beverage in the filled can. The foaming action produced removes the air from the headspace. On the flat top line, air is removed from the headspace by displacement with CO_2 gas from an undercover gasser on the closing machine.

The filled cans then move directly to a machine for closing. With minor modifications, the same equipment used for crowning bottles can usually be used for crowning cap sealed cans. However, crowning adjustments must be made carefully when cans are run to be sure that the crowning operation will produce an efficient seal without deforming the nozzle.

Filled flat top cans move directly into the closing machine or double seamer which attaches the cover to the filled can. These closing machines are engineered to operate at high speed—300-500 cans per minute—and are designed to accommodate cans of various diameters and heights.

The closed cans—cap sealed or flat top—are passed through a can warmer which raises the temperature of the can and product a few degrees above room temperature. This is done to prevent condensation of moisture on the otherwise cold surfaces of the cans and provides enough heat to dry the cans.

When the syruping system of packing is used, the cans must be subjected to a mixing treatment to insure thorough blending of the syrup and carbonated water in the container. In the bottling line this is accomplished in the bottle mixer, whereas, in canning it is usually accomplished by passing the filled cans through a series of twists and turns in the conveyor system.

The cans are conveyed through a weigher or fill checker which automatically rejects underfilled cans. In a canning line, a labeller is not required as the cans are lithographed. However, a coder is used to provide identification for each can before casing. Coded cans travel to the casing unit where they are packed, and the cases glued and sealed automatically. Filled cases are coded, again placed on pallets and are now ready for warehousing or shipment. Coding the case enables the canner to market the canned soft drinks in chronological order, thus eliminating unduly long storage for any particular lot.

Questions about canned soft drinks

Question. Cans have had some success to date. However, distribution has been limited. Does this mean that cans are only a "fad"?

Answer. General industry opinion is that cans are here to stay. We believe that the advantages of metal cans as a package for soft drinks will gain increasing acceptance in the soft drink market. In evaluating this year's results it must be remembered that cans are a new package to soft drink packers, retailers, and consumers. Many well-known brands are not yet available in cans. Promotion and distribution methods are not firmly established. These limitations are not necessarily permanent, but they do restrict can sales at this time.

Question. What features of the can command the premium at which canned soft drinks are often retailed?

Answer. The can is a "convenience" package—light in weight, unbreakable, easy to carry and store. Cans chill quickly. It is not necessary to return "empties". These features appeal to today's busy housewife.

Question. What share of the soft drink market will canned soft drinks eventually garner, in your opinion?

Answer. It is difficult to estimate the ultimate share of the market that the can will hold. This year about 33% of *packaged* beer is in cans. The soft drink and brewing industries are not exactly comparable, however. We would expect a lesser use of cans for soft drinks for some years to come.

Question. How many of the present soft drink canners use the can as their sole package; how many of them also produce glass-packaged soft drinks? What do you see as the future pattern in this respect?

Answer. Some soft drink canners today use only the metal package. Perhaps a greater number are also active and successful bottlers. Most concerns now considering use of the can are already established in the soft drink industry. Interest on the part of "outside" companies is at present very limited.

Question. Has any interest been shown in soft drink canning by the large canned food producers?

Answer. There has been some general interest in canned soft drinks among some packers of other canned foods. A few have done contract packing for others. This interest has, to our knowledge, not matured to a point where a food packer is producing soft drinks under his own label, however. Despite the apparent parallel between the canning of soft drinks and of perishable food products, food canning equipment is generally unsuitable for carbonated beverages. In addition, technical people trained for food operations are not necessarily expert soft drink producers. Marketing of canned foods entails a different sales and distribution set-up from canned soft drinks. Perhaps most important, the peak production seasons of most perishable crops coincide with the period of heaviest soft drink consumption.

Question. Do you believe that canned soft drinks will ever be competitive, price-wise, with bottled merchandise?

Answer. The economies of a *returnable* package will maintain the deposit

bottle's price edge for some time. However, because of its many advantages, we believe the can will compete effectively, even at a slightly higher price.

Question. For the picnic users or the casual buyer will not the "No Return Bottle" serve as well as cans?

Answer. The two packages do not possess the same advantages. The can is unbreakable, light in weight, takes less space, and chills quickly. Some consumers are accustomed to discarding cans but to saving and returning bottles even if no deposit is due. The experience of the brewing industry has been that cans will outsell non-returnable bottles by a large margin when both are priced to reflect actual costs.

Question. Which can style, Cap Sealed or Flat Top, is preferred?

Answer. At present the brands are about equally divided between Flat Top and Cap Sealed (cone top) cans. Until recently cap sealed cans have been in short supply. Briefly, the advantages of each style are as follows:

Cap Sealed	Flat Top
Easier to open (especially for children)	Less costly
Easier to drink from	Easier to stack
Less costly to convert bottling line to cans	Take less space
Withstand greater internal pressure	

The above factors have resulted in an apparent consumer preference for the cap sealed can, to some extent offset by a retailer preference for the flat top.

Cost-wise, the two cans alone are about the same. However, use of the cap sealed can is more expensive by the value of the crown closures, approximately 4½¢ per case.

Question. A year ago, when canned beverages first appeared, there was a limited supply of cans for those producers who wished to enter the field. If there was a "scarcity", it seems to have disappeared. Are there more can manufacturing lines in existence today?

Answer. The shortage of cans for soft drinks has eased because there are more manufacturing lines in production today. We and other can makers will have still more equipment available prior to the next peak season.

Question. To the bottler, what additional costs are involved in setting up a canning operation?

Answer. The most significant costs in setting up a canning operation are those necessary to equip to fill and close cans. A bottling line may be equipped to handle cap sealed cans part time or full time for about $20,000. A complete new canning line for either can style will cost around $100,000-$130,000. New can lines can run at 400 or more cans per minute.

Existing syrup room, water treating system, and other facilities may be used with either cans or bottles.

Personnel of the bottling line can be trained quite readily to handle cans.

Question. Is it possible to develop can liners for every soft drink flavor? If not, please explain.

Answer. Our engineers believe that research now in progress will lead to improved liners suitable for those products which are now most difficult to pack in cans.

Question. How much carbonation can be safely used in canned beverage products today?

Answer. This depends on the size and style of can. In general, the cone top can may be used for higher carbonation than the flat top and in the 12-oz. size may carry up to 5.0 volumes of CO_2 at normal peak storage temperatures.

Question. Is the "shelf life" now possible with cans too limited?

Answer. The shelf life possible with each product to be canned is determined, prior to packing, by careful tests.

Cans are sold by Continental only for products which can be held in good condition for the normal maximum interval between filling and consumption.

Question. Would you suggest that distribution of canned soft drinks be handled through food brokers or the packer's own delivery force?

Answer. The individual canner must select his own method of distribution. Packers using only cans, and without established sales organizations, have used brokers. Established bottlers, adding a line of canned soft drinks, have usually relied on their own distribution set-up, because of the coverage and "push" it affords at the retail level.

Question. Will the big canner be able to ship canned soft drinks economically from central plants to all parts of the country?

Answer. Despite the expanded markets possible with the lightweight can, large central canneries may have difficulty shipping great distances and retailing their products at a price competitive with local operators. The nature of the beverage industry differs somewhat from beer in this regard, and while canners may tend to have more centralized operations than bottlers they are likely to find it hard to absorb heavy freight costs, or to merchandise their product without local sales and promotion effort.

Question. It has been reported that dealers, while preferring the "convenience" of the can, are beginning to resent the smaller profit margins this item allows them. How can this be met?

Answer. We have not noticed any widespread resistance to "smaller profit margins" by retailing organizations who have measured costs carefully.

Such organizations seem to feel that a package that is easier to handle, such as the can, requires a lesser mark-up to yield the same net profit.

They therefore judge each package on its contribution to net profit per unit sold, not on the percentage margin possible. So judged, we have heard little criticism of the can at present price levels.

Soft Drink canners can sell their product by emphasizing these "facts of business life".

Question. Is there any great saving either for the packer or the grocer in using non-returnable containers, that is in the cost of handling?

Answer. Studies have placed the cost of handling returnable bottles in supermarkets at as high as 25¢ per case, although these costs are difficult to measure. Judging from the enthusiasm of most chains for non-returnable packages, it is apparent that they foresee considerable savings in their use. Each bottler's cost must be calculated individually, but obviously there is some expense in the collection, storage, and washing of returned containers.

Question. What are the principal tenets of establishing and operating a successful soft drink canning enterprise?

Answer. Soft drink canning is basically no different from any other business. A can is no magic guarantee of success. A good quality product must be produced at reasonable cost, and merchandised aggressively if the canner is to be successful.

[fol. 1251] GOVERNMENT'S EXHIBIT 600B

Continental Can Company, Inc.

Internal Memorandum

To: Location #43—Head Office
Attention Mr. M. M. Dukehart, Jr.
From: Location #43—Head Office
Date: May 26, 1953
Subject: Potential Market for Soft Drinks in Metal Cans

The forthcoming introduction of soft drinks in metal cans in the New York area by Cantrell & Cochrane again raises the question as to the potential place for metal cans in the very large soft drinks field. Two prior market tests (the Canada Dry test and the Pepsi-Cola promotion of 1950) provided little conclusive evidence as to whether the metal can will ultimately capture a significant place in packaging soft drinks. There are, however, enough significant new elements in the C&C promotion that the prospects for a successful invasion of the soft drinks field now appear very hopeful.

Total bottled soft drink (carbonated beverage) consumption in the United States is about *23 to 25 billion bottles* (all sizes). This is slightly larger than the packaged beer total of around 21 billion packages. Although growth since pre-World War II has been very substantial, in recent years increases have been little more than in proportion to population growth. Per capita annual consumption runs about 150 to 160 bottles, or about 525 to 550 bottles per household.

The extent to which metal cans could penetrate this tremendous market is, of course, not predictable at the present time—the big unknown being the untested acceptance of consumers. Other unpredictable factors will also influence the relative success of the forthcoming C&C venture (and other future similar attempts) but experience with the Pepsi Cola experiment, and even more, the brewing industry's experience with selling packaged beer in cans, offer some useful clues as to the potential metal can volume we may expect in soft drinks.

Assuming that the merchandising factors are favorable

and that the product quality is well received, the upper limit on market acceptance will then be determined by *price*. Detailed analysis of the market for canned beer presently indicates that about a 30% share of the market can be captured by cans where the competing bottled package retails in the vicinity of 15¢. In this price range the net cost of the can to the consumer is, under favorable conditions, about 2¢, or only about 13% of the price. This is after allowing for some production, shipping, and handling cost savings in relation to the bottled product. However, the realizable penetration which theoretically could be gained by cans—which in effect are a premium package—appears to go down geometrically as the retail price decreases. Where the retail price of the packaged product is around 10¢, the sales potential for cans would be very much lower, possibly about 10% of the total sales volume. As the retail price goes below 10¢, the potential for cans is probably even further reduced because the net cost of the can to the purchaser approaches 40% of the retail selling price of the bottled package, where the latter sells at a price of around 5¢. In the Pepsi-Cola test it appeared, for example, that a minimum level of 2% could be maintained for cans. Under the more favorable conditions foreseen for the 6 oz. can to be used by C&C, a penetration of 5% appears more likely.

On a *conservative basis*, therefore, the potential for cans in the soft drinks field can be approximated—on a very rough basis—as indicated in the following table. Also underlying these estimates is the assumption that product quality and merchandising effectiveness are sufficient to gain and sustain a level of consumer acceptance.

[fol. 1252] **Estimated Minimum Penetration for Metal Cans for Packaged Soft Drinks**

(assuming national distribution)

	Total	Small Size (Mainly 6&7 oz.)	Medium Size (Mainly 12 oz.)	Large Size (Mainly 28 oz.)
Est. 1953 Soft Drink Sales (Billions of Bottles)	24.0	18.0	3.5	2.5
Coca-Cola	12.0	12.0	...	...
Other Soft Drinks	12.0	6.0	3.5	2.5
Est. Can Penetration		2-5%	10%	...
Est. Can Requirements (Millions of Cans)	700-1,250	350-900	350	...

The Cantrell & Cochrane Venture

There are certain plus factors present in the C&C program which add substantially to the likelihood of success as compared with earlier unsuccessful ventures.

1. Since there does not already exist a bottled product of the same company against which the cans must compete, there is a natural fundamental incentive to push the C&C product *in cans*, and not to treat it as a secondary package as would be the case with an established bottling company.
2. There are potential economies of production possible with a central canning plant which would not be possible with smaller, decentralized local bottlers.
3. The distribution channels selected should be much more effective for the canned C&C product than was the case in earlier ventures. Almost all chain food store operators in the New York-Metropolitan area have been sold and are reportedly enthusiastic about the possibilities of this product. Furthermore, food wholesalers—a new channel for soft drinks—will be used to effect distribution. This is a plus item for food wholesalers and they will have an incentive to push it. Their usual margins are less than those obtained by beverage wholesalers but will be more favorable than for most other products handled by food wholesalers.
4. There is a special appeal for children (largest consumers of soft drinks) with these two new packages, and in our opinion this should be particularly true of the 6-ounce size. Not only is the package itself very attractive and convenient, but the nonbreakable feature should provide an advantage with parents of younger children.
5. The C&C line of products in cans will not compete with the same brand—especially an economy brand—in bottles. Thus there will be less tendency on the part of consumers to compare the price in one kind of package versus another.
6. Since 1950, when an adverse price relationship more than any other one factor killed the Pepsi-Cola-in-cans experiment, prices of soft drinks have risen

enough that a canned soft drink will be less at a disadvantage in terms of price.

[fol. 1253] There are also, however, some limiting factors which must also be considered.

1. The C&C brand is unknown and will have to be *sold*, regardless of the packaging feature. This should not be a serious obstacle, however, because it is doubtful that brand preference is very strong in soft drinks (except for Coca-Cola), and the disposable can—a new package—offers a natural merchandising feature to stimulate trial purchases.
2. The C&C soft drinks in cans will be generally at a price disadvantage which is bound to limit sales wherever potential consumers are economy minded. Since this is a critical factor, it is discussed in more detail in the attached call report.
3. The shelf life of the product, to our knowledge, has not as yet been completely tested. If technical difficulties on this score should arise, the C&C venture may run into some temporary setbacks, although it is expected that ultimately such technical problems can be satisfactorily overcome.

Actually the big *if* in this forthcoming test is the element of consumer acceptance on a *sustaining* basis. It will, of course, be observed carefully by other companies in the soft drinks field, and even a reasonable success this season is likely to bring other companies into the field before the 1954 season. The merchandising, advertising, and promotion program of C&C appears to be sound, and a budgeted advertising expenditure at an annual rate of $600,000 (equivalent to about $5,000,000 on a nationwide basis) is bound to generate a substantial volume of sales, at least in the earlier part of the season when the promotional effort is at its peak.

In order that we may be adequately informed as quickly as possible about the extent and development of consumer acceptance for the C&C product, we have arranged to obtain the results of a series of surveys which will be conducted for the Cantrell & Cochrane organization. The details of this program are covered in the attached call report.

As information becomes available, we will provide you with further reports which we hope will prove helpful in preparing to meet future can requirements.

The equipment program of three new lines for each size, as outlined in your letter of May 19th, appears at this time to represent about the minimum which should be committed by Continental in preparation to meet 1954 requirements. There is some question as to whether production will be needed at St. Louis in 1954, but we believe that the lines should be available in 1954, with ultimate location to be decided later. Top priority should be given for the cone and bottom dies, waxing equipment, and side seam tools for the 6 oz. lines in order that existing 202 diameter lines at other locations could be used for 1954, since the new lines may not be available in time for the peak season.

If the C&C venture is only moderately successful in the New York area (about 10% of the U.S. market) this year, it is still likely to draw other companies into the field, and 1954 will probably see C&C and other companies extending the use of cans toward nationwide distribution. Thus, 1954 could be a critical year for Continental to make the most of what shows promise of being a sizeable new market for metal cans.

Market Survey Data for Soft Drinks in Metal Cans

Re: Cantrell & Cochrane

Yesterday, the writer called on the Ted Bates Advertising Agency in order to secure and discuss the latest statistical data from the market surveys being conducted by that

agency in conjunction with the introduction of Cantrell & Cochrane soft drinks in the metropolitan New York market.

Briefly, the results to date can be described in total as very favorable, and the survey data are now beginning to be somewhat indicative of what the actual results at the end of the summer season seem likely to be. Specifically, the two continuing tests now being conducted indicate the following thus far:

Sample Survey of Market Penetration

Starting with June 2 and each two weeks thereafter, a sample telephone survey has been conducted, to determine the approximate percentage of total soft drink purchass in the preceding seven days represented by C & C beverages. These telephone checks were made in the five boroughs of New York and were based, in each case, on about 800 to 900 interviews. The results through August 3 are shown in the following table (which must be treated as confidential).

Trend in C & C Share of Purchases

	June 2	July 7	July 20	August 3
Interviews	855	877	789	840
Purchasers*	472	501	446	456
Total Units Purchased	5,747	6,308	6,081	4,949
% of Total Purchases				
Canada Dry	9.2	5.8	6.4	
Hoffman	9.4	11.8	11.4	
Pepsi	21.1	18.5	18.8	
Coca-Cola	25.2	25.9	23.6	
Miscellaneous	32.5	34.7	36.5	
C & C	2.6	3.3	3.3	6.9
% Repeat	1.7	1.4	1.3	2.7
# Cans	150	208	203	342

*Purchased soft drinks in the preceding 7 days.
Note: No further checks are now scheduled until August 31.

[fol. 1255] I would like to caution that the rather spectacular results in the August 3rd check are subject to question, and the penetration percentage (6.9) should be considered as having a potentially important sampling range of error. It is significant that the trend in C & C share of purchases is up and also that the percent of repeat purchases is up, but the number of cans purchased by respond-

ents in the sample is still relatively very small. Two factors may have contributed to the very sharp rise in the C & C percent in the latest week: (a) total soft drink purchases during the preceding seven days were sharply reduced, partly due to the fact that the weather was generally cool during that period; and (b) during the two weeks preceding August 3rd an intensive drive was conducted to get distribution of C & C beverages into the independent stores. It does appear likely, however, that a consistent C & C percentage share of the market could exceed 5%, although these early returns are by no means conclusive, mainly because the "curiosity" phase has not been passed and it is impossible yet to estimate a sustaining percentage based on repeat purchases.

Store Check Analysis by Flavor and Can Size

Since May 20th a continuing analysis of sales to the stores in the Shopwell Food Chain has been conducted. These stores have been used as a test operation in which store stocks are controlled so that at all times each flavor and each can are fully stocked and displayed. Sales by flavor and by can size in these stores thus reflect, on a sample basis, a quick measure of the popularity of each flavor and of the two can sizes. The latest available figures are shown in the following table:

C & C Soft Drink Sales
Shopwell Food Stores
May 20—July 27

Flavor	12 ounces (cases of 24)	6 ounces (cases of 48)
Coola	850	310
Root Beer	840	310
Ginger Ale	550	255
Grape	550	265
Club Soda	175	.....
Total Cases	3,065	1,140
% of Total	72.9%	27.1%
Total Cans	73,560	54,720
% of Total	57.4%	42.6%

[fol. 1256] Sales of Coola are good, but are not showing the strong lead that was hoped for, and ginger ale and club soda have been very disappointing in proportion to expected results. On the other hand, root beer has been surprisingly strong and grape has sold better than expected.

The 6 ounce size is holding up surprisingly well, sustaining a ratio of better than 2 cans for every 3 12 ounce cans sold, in the test stores. However, this can be very misleading as a representation of the over-all popularity of the 6 ounce size since many stores other than Shopwell (especially large volume super markets) are refusing to stock the 6 ounce size. The results do show that the 6 ounce size will sell where stores are willing to stock it and display it, but we cannot ignore the apparent fact that many large volume, rapid turn-over store not only dislike stocking both sizes but feel that they get a better margin by selling only the 12 ounce size.

Consumer Acceptance Survey

Because survey results to date are very difficult to assess in terms of actual product acceptance by consumers, and also because the ginger ale and club soda in particular are showing up relatively poorly compared with the root beer, the agency is moving up its plans for a consumer acceptance survey. In order to obtain as early as possible detailed information about consumer acceptance of the products, a home interview survey is to be undertaken during August instead of, as formerly planned, in September. These interviews will be conducted in approximately 1,000 homes, and tabulated results should be available late in September.

This survey should provide the kind of information which we urgently need in order to assess the potential for canned soft drinks. I recommend therefore that we wait for results of this study rather than conduct one of our own at this time. If this survey later proves to be inadequate, we will still have the opportunity to conduct our own survey.

It may, for example, indicate how consumers feel about *product quality* and whether (as we suspect) reports of low carbonation of ginger ale and club soda—and perhaps the Coola also—might be limiting the success of this introduction of soft drinks in cans.

D. H. Walker.

Attitude of Grocery Chains Toward Canned Soft Drinks

Since super markets, particularly those affiliated with large chains, appear in theory to be excellent outlets for canned soft drinks, Continental has discussed this subject with marketing executives at the headquarters of several well known chains to determine their attitude towards the metal package.

The opinions expressed by the chain executives were quite uniform, with only limited differences based on geographic location or size of chain.

It is apparent that a non-returnable package, particularly a can, is of great interest to these stores because it will eliminate the costly handling of returned bottles, and because it permits them to accept the deliveries at a central point rather than at each individual retail outlet. The chains are thus enthusiastically behind canned soft drinks.

The opinions they have expressed on various aspects of this situation are outlined below. You may find this information of value in discussing the problem with soft drink packers.

Attitude of Chains

The chains we contacted were universally in favor of increasing the use of cans for soft drinks. In this respect they differ from the smaller retailers, who are less enthusiastic. In some instances, chains have actually eliminated returnable bottles from some or all of their stores, and we feel most would like to see this trend continued as soon as it becomes practical on a wider scale.

Chains report no particular consumer objection to the can as such, although they do point out that the new package is hampered by a higher price, and the fact that few "name" products are available in cans.

Products Packed

Several chain executives pointed out that the prestige of cans for soft drinks would increase greatly if a name brand such as Coca Cola were packed in metal. At present in many areas no well established brand is available in cans, and there is some consumer feeling that the can is suitable only for the lesser known products.

March 4, 1955.

A New Look at Soft Drinks in Cans

The summer of 1954 saw wide acceptance of the metal can as a soft drink package. The merits of the can proved of interest to certain packers as a means for increasing their sale of soft drinks; metal containers demonstrated advantages over other packages in certain distribution channels and with many groups of consumers.

While the introduction of cans was in general received favorably several obstacles to further growth were apparent. These included the following:

(1) Some packers visualized the can as a threat to their established bottling business, while others hesitated to accept it believing that no-return packages were a fad and would be discontinued.

(2) Can specifications available last summer were unable to provide adequate shelf life for some products, or to protect the quality of some others.

(3) Supply of cans was short, especially in the early months. The range of sizes and styles available was restricted.

(4) Because of some of these conditions many con-

sumers gained the impression that top quality soft drinks were not available in cans.

For 1955 Continental has developed a program which we believe answers many of the problems that became evident during the past season.

We now offer containers and services to back them up, to assist the soft drink industry in selling more of its products.

Experience to Date

The convenience of no-return packages is becoming more and more apparent to the purchasers of soft drinks, and to those engaged in producing and distributing them. The growing use of no-return bottles, and more recently of cans, is estimated below:

Year	No. Return bottles (millions)	Cans (millions)
1949	7	–
1950	24	–
1951	26	–
1952	64	–
1953	126	70–80
1954	138	450–500

[fol. 1259] These figures show a dramatic rate of growth, demonstrating the fact that for many consumers the advantages of a no-return package outweigh the few additional pennies per case involved.

Nor is this trend peculiar to the soft drink industry. Almost 40% of packaged beer is already sold in no-return bottles or cans. The deposit milk bottle is fast giving way to the wax paper carton. These shifts are accelerated by the growing use of self-service in stores, the increased cost of labor necessary to handle return packages, and improved consumer living standards which include "convenience" items.

Not only does the busy housewife benefit from elimination of the chore of collecting and returning bottles, but the retailer avoids the nuisance of buying and selling bottles at no profit, the distributor has no collection worries, and the packer has no capital tied up in empty bottles stored in someone's kitchen.

The immediate future is likely to see an increasing demand for no-return packages.

How does the can stand compared to other non-returnables? The figures above answer that question. Although the can has been on the market only a very limited time, estimated soft drink can shipments exceeded shipments of non-returnable bottles by almost 4:1 in 1954.

The can has achieved this position because of advantages inherent in metal containers.

(1) *The can is light in weight.* For instance, a 12-oz. Pepsi Cola bottle weighs 15¾ ozs., a 12-oz. can 2½-ozs. A 10-oz. Dad's Root Beer bottle weighs 14½-ozs., a comparable can less than 1/5 as much. A 6-oz. Coca Cola bottle weighs 14-ozs., a 6-oz. cap sealed can only about 2-ozs. This weight saving means a saving in freight costs.

(2) *The can takes less space.* For instance a 10-oz. flat top can takes 41% less space than a comparable returnable bottle. The 12-oz. cap sealed can takes 35% less space than the 12-oz. Pepsi bottle, and the 6-oz. cap sealed can takes 51% less space than the Coca Cola bottle. These space savings mean that more cases can be placed on a truck, stored in a warehouse, or held in reserve in the supermarket's back room.

(3) *The can is faster to fill.* Production savings are realized by filling cans at up to 400 per minute, compared to much slower speeds typical of glass bottle filling lines. Even when existing equipment is converted to cap sealed cans the speed of the line is often increased because the washer-soaker is no longer needed.

[fol. 1260] (4) *Cans are easier to handle.* Not only are cans lighter, and less space consuming, but they are unbreakable as well. In addition, there are no empties to collect, sort, inspect, and wash prior to use.

(5) *Cans are better to display.* Cans are more readily stacked than bottles. Colorful lithography contributes to impulse buying. Most important, the space saving features of cans result in tremendous

economies in shelf space, very important to supermarket operators.

All of the above advantages work for those who must make a profit from the sale of soft drinks—the packer, distributor, and retailer. The advantages of cans to the consumer—less space in the refrigerator, chill quicker, no returns, unbreakable—are too familiar to require repetition.

It would appear that the growing use of cans for soft drinks is on a sound footing, and can be expected to continue.

Can Specifications for 1955

In the past there has been some criticism of the can as a package for quality soft drinks. Some packers have claimed that the shelf life provided for their products was inadequate. Others have stated that contact with the metal of the can affects the taste or appearance of the soft drinks they pack. Some consumers have held the impression that canned soft drinks were of low quality.

Up until now most of the cans available for soft drinks have been modifications of cans developed primarily for other purposes. This year, however, Continental offers both cap sealed and flat top cans made to specifications developed especially for carbonated soft drinks. These specifications answer many of the criticisms previously raised.

For cap sealed cans we have added the following features:

(1) Compound Lined Nozzle Curl

A layer of E-4 compound has been placed inside of the nozzle curl of the cones of cap sealed cans. This compound seals off the exposed cut edge of metal which occasionally has come in contact with the product and resulted in added iron pick-up.

(2) Filleting Compound

A special compound has been adopted for use in the top and bottom double seams. During double seaming this compound squeezes out into the crevices normally existing between body and end, pre-

venting abrasion of the enamel at this point, and shutting off the double seam area from the product. Ends with this compound can be expected to show zero metal exposure at the double seam, a point at which soft drink cans were occasionally susceptible to failure.

[fol. 1261] (3) New Inside Side Stripe

An improved material has been adopted for the inside side stripe on capsealed cans. This material is less permeable than those previously used; its use reduces metal exposure at this critical area.

These improvements are being adopted on virtually all of our cap sealed lines for this summer. Commercial quantities of cans of the new specification are already available from our Clearing #5 plant.

Our flat top can for soft drinks has also been completely remodeled. Since it was not as resistant to high pressures in 1954 as the cap sealed can, it has been necessary to make a somewhat greater number of modifications.

(1) High Pressure End

The contour of the end has been altered, to withstand pressure equivalent to that developed by 4.0 volumes of carbonation at 110°F.

(2) New Side Seam

A 6 tab interrupted lock and lap side seam (STK-415) has been adopted. This side seam increases resistance to bursting, and gives greater manufacturing latitude in providing a good solder fillet, which is essential if metal exposure is to be held down at the side seam area.

(3) Filleting Compound

This new development is used on the flat top can also.

(4) New Base Enamel

An Epon type base enamel has been adopted. This new material contributes to reduced metal exposure.

(5) New Side Stripe

A new side stripe is being used for the flat top can.

Cans made to these new specifications are especially designed for soft drinks. The improvements permit the packing of a wider range of products and carbonations. In addition, greater shelf life is provided for many of the products already packed, and product quality is more completely protected within the container.

Availability of Cans

In contrast to last year, we have plenty of manufacturing capacity available for most sizes of soft drink cans. Additional lines were installed during 1954, and more are going in this spring. With the exception of the newest sizes, there should be no limit to our ability to meet reasonable demands of the industry.

[fol. 1262] Continental is the only major can company supplying both styles of container. Thus prospective canners have a greater flexibility of choice, and are assured of more objective recommendations, when dealing with us. In addition, we are prepared to furnish a wide variety of sizes, to permit packers to offer the size package most desired in their market, and most adapted to their price structure.

The following cans will be available:

(1) Cone Top

6-oz.—202 x 311 (Body Height)
9-oz.—202 x 503 " "
12-oz.—211 x 407.5 " "
32-oz.—312 x 600 " "

(2) Flat Top

10-oz.—207.5 x 413
12-oz.—211 x 413
16-oz.—211 x 604

The 6-oz., 12-oz., and 32-oz. cap sealed cans and the 12-oz. flat top were used in important quantities last year and are readily available for 1955.

Sufficient equipment has been ordered to make limited quantities of 9-oz. cap sealed cans by early summer. Thus market tests of this size can be made in the near future; if demand warrants it will be possible to equip more lines to make this can.

The 10-oz. flat top can will be made available at locations to be determined after actual users have been identified.

The 16-oz. beverage can will be available from any plant now making 16-oz. beer cans. For immediate delivery we are able to supply cans holding up to about 3.0 volumes of carbonation at 110°F. Given approximately 3 months notice, we can provide tooling to make a can holding up to 4.0 volumes under similar conditions.

This range of styles and sizes, available in substantial quantities, gives Continental's customers a selection unmatched by any other supplier. This can be a particularly good selling point in dealing with larger concerns who have not yet decided upon size, style, or supplier.

Thus our "new look" reveals a favorable market for soft drinks in cans. To help the packer exploit this opportunity Continental can provide:

(1) Top quality cans.
(2) A choice of style and sizes.
(3) Available in quantity.

[fol. 1263] Our technological advances and increased production facilities "load the bases" for our customers.

For the means to "drive home the runs" for them we refer you to the summary of our Soft Drink Can Advertising and Sales Promotion Program.

SBS/m

March, 1956.

Mr. L. A. Carey
#43 Head Office

The Economics of Cans for Soft Drinks

The greatest obstacle to the progress of the soft drink can is the cost of the package. Admittedly, the can is a convenience package for which the consumer must pay a premium price. When given the opportunity to buy a canned soft drink of established quality in a can, however, the consumer has demonstrated his willingness to pay a price which will allow the packer and the retailer a fair profit.

In order to obtain a clear picture of the economics of adding a can line to an established bottling operation, we have analyzed operations where the can has been added successfully as a supplementary package to a bottle line with good consumer acceptance.

Based on the cost data obtained from these actual operations, we have made a comparison of the relative costs of a case of 24 10-oz. bottles and a carton of 24 10-oz. flat top cans. The attached table shows a typical packer's cost set-up. While these cost figures could not be applied directly to a particular packer's operation, they do provide a factual basis for determining the cost relationship of the can and the bottle.

The costs shown in the attached table have been developed in considerably greater detail and we can discuss them more specifically with any packer who is interested. The attached summary should be fully adequate in most cases, however.

Only two items in the packer's costs should require explanation. The container cost per trip for the returnable bottle is one item which very few, if any, packers really know. The figure we use is a very conservative one. It represents only actual out-of-pocket expenses for bottle and case replacement or repair over a long period, divided

by the number of cases actually shipped during that period. No charge has been made for the large capital sum which is tied up in bottle and case inventory. Our estimate of this cost item could very well be understated by several cents per case.

The cost of distribution is another item which will vary widely from one place to another. In this case we have used the same figure for both returnable bottles and cans. This was done because in some areas delivery crews are paid on a weekly basis and do not receive overtime pay. In most instances, however, time spent picking up empty bottles will add to the delivery cost and the cost of delivering cans will be significantly lower than the cost of delivering bottles and picking up empties.

[fol. 1265] On the basis of this study, then, we arrive at a cost to a bottler-canner of $1.43 per carton of 10-oz. cans compared to a cost of about 80 cents for a case of 10-oz. bottles delivered to the retailer. This leaves a difference of 63 cents between the two packages. Because of our treatment of the container cost and distribution cost items, this difference is probably overstated by as much as five cents.

Thus, a packer could price his canned product at about 60 cents per case above the price of his bottled goods and realize the same profit per case without any capital investment in the containers. What that price would be would depend on the prevailing bottle price in the particular market. However, a price of $1.20 for bottles and $1.80 for cans would represent a very satisfactory level.

If the retailer adds the same per case markup to cans that he does to bottles, the retail price per can will end up at 2.5 cents more than the bottle price, excluding the deposit. Ideally, we would like to see the can price held at a level equal to the price of the bottle plus deposit. This would mean that the retailer would have to accept a markup of half a cent per can, or 12 cents per case, less for canned soft drinks than for returnable bottles.

No retailer will deny that handling deposit containers is a nuisance and involves an additional cost to him. Virtually none, however, have any clear idea as to just what it does cost them to handle empty bottles and deposits. Actually, the cost will vary very widely from store to

store, depending on the volume involved and the method of handling. In the case of the small owner-operated store the cost is probably entirely one of additional time and effort rather than a monetary one. In the case of the chain super-market, however, empty deposit bottles being returned in rush hours, as they usually are, involve both costly labor and a nuisance which cannot be evaluated in terms of pennies.

We have made a survey of a number of large super-markets in an effort to put a dollar-and-cent figure on the cost of handling returnable bottles. Because of the manner in which this problem is handled by the stores, a scientific time study was not practicable. In lieu of this we questioned the store managers regarding the volume of soft drink sales and the hours their employees devote to redeeming and sorting returned bottles. In some instances the cost was quite apparent as most of the work was done by part-time help hired for just that purpose. In other cases the cost was more difficult to arrive at as the job was done intermittently by regular employees.

We could not arrive at any one figure which could be used generally, because no two operations are identical. But we did find this: some store managers estimated their cost of handling return bottles at as much as 20 cents per case; the lowest estimate obtained was ten cents per case. Probably 15 cents per case would be a fair average overall; in any event it is quite certain that most retail stores spend at least twelve cents per case on this task.

This means that any retailer can sell cans at the same price as returnable bottles (including the deposit) and make the same profit per case with less labor and nuisance if the difference in his cost is 60 cents per case. The packer, on the other hand, can sell his canned product at 60 cents per case more than his bottled product and make the same profit per case with no capital investment in returnable packages and a much simpler operation in his plant.

[fol. 1266] Unfortunately, there is a great deal of misconception today regarding the profitability of the can. In some markets the prevailing bottle price is so low that the packer cannot make a fair return. In such areas the

can will not be able to yield a fair return either unless the price differential is greater than the actual difference in cost between the two packages. In other cases retailers use soft drinks as "loss leaders" to build store traffic. If canned beverages are to compete in such markets, they too must be priced at an unprofitable level. In other words, the can cannot develop substantial profitable volume in a market where either the packers or the retailers are maintaining returnable bottle prices at an unprofitable level.

We know that canned soft drinks can develop substantial volume when they are marketed as a supplementary package to a bottle line at a retail price equal to the price of the bottle plus deposit. At this price level, the can will return the same profit per case to the retailer and the packer as the returnable bottle. And it has been proven time and again that the can will produce *extra* volume and *extra* profits for the bottler who adds it to his line.

Such major brands as Nehi, Dr. Pepper, Cott, Mason, Hires and Graf have demonstrated the profitability of the can to their own satisfaction. We have the facts and figures to discuss this with any other bottler who is interested in adding to his sales and profits by opening the door to a new market by adding the can to his product line.

While the figures we have used here are for 10-oz. containers, they can readily be converted into other sizes to fit any particular case. For the most part, a change in container size will affect only the cost of the container itself and the contents.

[fol. 1267]

Comparison of Costs

Bottles vs. Cans for Soft Drinks

Item	Per Case of Bottles (24–10 oz. Bottles in Wooden Case) Description	Cost/Case	Per Carton of Cans (24–10 oz. Flat Top Cans in Carton) Description	Cost/Carton
A. Container Costs	1. 10-oz. Bottles and Cases	.1055	1. 10 oz. Flat Top cans	$ .748

CANNED FOODS MEET HIGHEST QUALITY STANDARDS

Because of canning, the retail store of today offers its customers a world of products — available in any town, at any time of the year. Pineapple from Hawaii, salmon from Alaska, sardines from Maine, mushrooms from Pennsylvania, pimientos from Georgia — all these and some 500 other canned foods are within arm's reach and at a price everyone can afford.

Yet, consumers are seldom aware of the quality standards set for the canned foods they take for granted.

WHY STANDARDS?

Why do we need canned food standards? To make it easier for everyone to buy exactly the kind of product he wants. For example, each can of fruit cocktail contains the same kinds of fruit. The *Standard of Identity* limits the use of the name "Fruit Cocktail" to that definite mixture of fruits. Of course, one also wants to buy canned foods of reliable quality. The *Standard of Quality* requires that every can meet an established Quality Standard. One expects a can or jar to be full: The *Standard of Fill-of-Container* ensures a properly filled package.

ARRIVING AT STANDARDS

How do we get food standards? Drafting of standards is a joint Government-industry enterprise. The Federal Food law provides that standards may be established whenever they will promote honesty and fair dealing in the interest of consumers.

The first canned food standards were simple definitions of products, established by the U. S. Department of Agriculture before the passage of the first Pure Food Law in 1906. As the canning industry developed, there was desire for more complete standards. In 1930 the canning industry added to the Pure Food Law the McNary-Mapes amendment providing for a minimum standard of quality and fill of container for canned foods. But the establishment of these standards was handicapped by the lack of a precise definition for each canned food. So, into the new Food, Drug, and Cosmetic Act of 1939 there was written a provision for the formulation of mandatory standards for identity, quality, and fill of container not only for canned foods but for most processed foods in package form.

NCA ACTIVITIES

Foremost among the industry groups working for the highest quality standards is the National Canners Association, this year celebrating its 50th anniversary. Through its divisions, NCA is active in research, labeling, home economics, etc.

Its *Raw Products Bureau*, for instance, has helped agricultural specialists redesign many fruits and vegetables to improve their quality. It acquaints canners and growers with the latest findings on useful agricultural and canning procedures. It encourages the development of new machinery and keeps track of work done in pest control, soil fertility, irrigation and plant breeding.

FIRST IN RESEARCH

NCA was the first trade association to establish research laboratories, since it has always been their aim to assure, for the mutual benefit of the industry and the public, the best food that scientific knowledge and human skill can employ.

As far back as 1922, NCA made nutrition news by publishing the first study on the vitamin content of canned foods. During the past fifty years many similar contributions have helped NCA members achieve their goal of better quality. Today NCA laboratories in Washington, Berkeley and Seattle employ more than 50 scientists and technicians to do research on projects dealing with quality improvement in canning, such new techniques of preservation as atomic radiation, and many other technological programs.

LABELING

Clearly written, informative can labels have become a canning industry feature partly because of the work of the National Canners Association's Labeling activities. They help canners prepare label copy that will give shoppers complete information on the product inside the can in easily understood language. Since most people shop in self-service stores, it is the can label that answers their questions about the product. Members of the NCA staff work continuously to find just the right words to describe each canned product precisely and honestly. Information always includes the complete name of the product, the net weight of the contents, and frequently offers suggestions on product preparation.

CONSUMER SERVICE

NCA's *Consumer Service Division* gives its attention to product use and recipe development for both consumers and institutions. This is NCA's closest link with consumers because it gets right to the point — how to make the most of the many canned foods they buy. Editors and broadcasters regularly receive recipe information suggesting new and varied uses for canned foods, and illustrating how such products can be put to work in the kitchen for a maximum of convenience, economy and good flavor. Teachers, home economists and people who run institutional kitchens get educational material giving the latest nutritional facts on canned foods and advice on appealing ways of preparing them for large numbers of people. Canners get recipe ideas for their labels.

These various activities are but a few of the ways NCA is contributing to higher standards for canned foods. They are certainly the reason for the fact that there are now some fifty different canned foods for which standards have been established.

Yet, consumers are seldom aware of the quality standards set for the canned foods they take for granted.

WHY STANDARDS?

Why do we need canned food standards? To make it easier for everyone to buy exactly the kind of product he wants. For example, each can of fruit cocktail contains the same kinds of fruit. The *Standard of Identity* limits the use of the name "Fruit Cocktail" to that definite mixture of fruits. Of course, one also wants to buy canned foods of reliable quality. The *Standard of Quality* requires that every can meet an established Quality Standard. One expects a can or jar to be full. The *Standard of Fill-of-Container* ensures a properly filled package.

ARRIVING AT STANDARDS

How do we get food standards? Drafting of standards is a joint Government-industry enterprise. The Federal Food law provides that standards may be established whenever they will promote honesty and fair dealing in the interest of consumers.

The first canned food standards were simple definitions of products, established by the U. S. Department of Agriculture before the passage of the first Pure Food Law in 1906. As the canning industry developed, there was desire for more complete standards. In 1930 the canning industry added to the Pure Food Law the McNary-Mapes amendment providing for a minimum standard of quality and fill of container for canned foods. But the establishment of these standards was handicapped by the lack of a precise definition for each canned food. So, into the new Food, Drug, and Cosmetic Act of 1939 there was written a provision for the formulation of mandatory standards for identity, quality, and fill of container not only for canned foods but for most processed foods in package form.

NCA ACTIVITIES

Foremost among the industry groups working for the highest quality standards is the National Canners Association, this year celebrating its 50th anniversary. Through its divisions, NCA is active in research, labeling, home economics, etc.

Its *Raw Products Bureau*, for instance, has helped agricultural specialists redesign many fruits and vegetables to improve their quality. It acquaints canners and growers with the latest findings on useful agricultural and

NCA was the first trade association to establish research laboratories, since it has always been their aim to assure, for the mutual benefit of the industry and the public, the best food that scientific knowledge and human skill can employ.

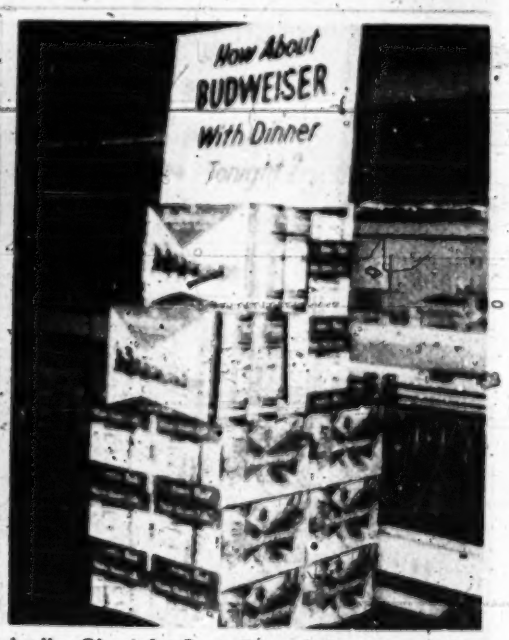
These various activities are but a few of the ways NCA is contributing to higher standards for canned foods. They are certainly the reason for the fact that there are now some fifty different canned foods for which standards have been established.

Double Value. What do customers like better than a bargain? Another bargain! That's why this display of pork and beans at Verscharen's Food Market in Pittsburgh goes over so big. The product is multiple-priced and wrapped – eight to a package – in a re-usable polyethylene bag. Shoppers not only save money but take home a serviceable plastic bag free of charge. Owner Henry Verscharen says that many of his customers, who normally buy no more than two or three cans at a time, thought so much of this offer that they took home the eight-unit package. The bags can be used for many jobs around the house – storing fruits and vegetables, holding dampened laundry or for wrapping and protecting silverware. *If you'd like further information about these attractive, useful bags, write the Shellmar-Betner Flexible Packaging Division, Continental Can Company, Mount Vernon, Ohio.*



Ladies Cheer for Beer. Be ready for warm weather with plenty of canned beer displays. But, don't concentrate on just the men. Your women shoppers will buy a lot more beer, too, if you aim some of your promotions at them. For instance, try a display like this "dinner idea" used at an Associated Food Store in Flushing, N. Y. Their simple sign suggestion gets the point across.

SELLING MORE CANNED SOFT DRINKS

Story on Page 2

CANNED BEVERAGE SHOWCASE. At Ralph's Market in Downey, California, this middle-aisle display introduces a busy shopper to canned soft drinks and chalks up an impulse sale. Like most of your customers, she takes time to examine special displays because she knows they are a showcase for interesting new products as well as money-saving values.

CANNED SOFT DRINKS MAKING HIT WITH SHOPPERS

Hundreds of millions of canned soft drinks are being sold this year — their popularity is growing fast! However, many of your customers have yet to try this new product. Start cashing in on the extra profits and convenience that canned carbonated beverages offer you by convincing shoppers to buy that important first can. After that, the quality and taste they find inside will keep them buying.

Play up these features in your displays, advertising and point-of-sale material: Canned soft drinks chill quickly; they take up less space in the refrigerator; there are no empties to return and no deposits required. They're safe for the children to handle — can't chip or break. Follow the example of these retailers and start promoting canned soft drinks now!

START CANS MOVING. Since most shoppers go directly to the

Like most of your customers, she takes time to examine special displays because she knows they are a showcase for interesting new products as well as money-saving values.

START CANS MOVING. Since most shoppers go directly to the soft drink section for their favorite beverages, this Pennsylvania supermarket makes sure that the new canned variety gets equal shelf space with bottles (photo left). On one shelf, space has been conserved by putting small cans in front of taller bottles and a large area has been set aside for family-size cans on the bottom. Multiple pricing is also used to start cans moving (photo right). Although many canned beverages don't come in multiple packs, shoppers usually buy more than one at a time and appreciate the saving.

22814

BOTTLERS, RETAILERS, SHOPPERS. GETTING ON CANNED SOFT DRINK BANDWAGON

Although a comparative newcomer to the popular, highly profitable canned goods line, canned soft drinks are rapidly outgrowing their baby pants. Their acceptance by bottlers, retailers and consumers continues to increase as each group realizes the benefits of these easy-to-handle, easy-to-serve beverages.

A recent article in "Food Processing" magazine shows just how great an impact canned carbonated beverages are having on overall soft drink volume.

For instance, the magazine states that of the leading soft drink processors, 19 out of 28 are now using cans to some extent. These firms include such well-known names as Coca-Cola, Pepsi-Cola, Canada Dry, 7-Up, Nehi, Dr. Pepper, Coff, Meyers Dry, Hoffman, Chicopee Club, White Rock and Mason.

Nehi Corp., the No. 1 U. S. canner, reports that 1958 can sales exceeded 1957 by 50%. Shasta Water Company, a West Coast bottler, reports that sales for the year preceding their change to cans were 884,000. Present sales are more than 32 million. And, results achieved by a promotion-minded franchisee in South Carolina shows an increase in total can sales of 98% in 56 over 55 in a 49-week period.

Bottlers were not the only ones to benefit from the switch to canned soft drinks. Retailers, too, reported amazing increases. The "Food Processing" article cites an A&P survey of 19 of its outlets in Charlotte, North Carolina, to prove this. The survey reveals that canned soft drink sales increased in 1958 over 1957 while sales of bottled beverages rose only one-half during the same period.

Not only do cans help the retailer improve his soft drink sales, but they also promise to help him solve the serious problem of rising costs in the handling of returnable empty bottles. According to one recent handling costs study, the average retailer gross profit on a case of bottled soft drinks ranges from 20 to 28 cents. But, the average gross profit on a case of canned soft drinks ranges from 32 cents to 41 cents. The per case profit on the bottled drinks is reduced an average of another 12 cents by the handling costs.

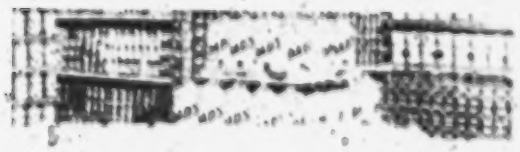
Favorable consumer reaction to canned beverages is based on a number of factors. Foremost among them is the willingness to pay for the convenience represented by "canned beverages." They're easy to use, easy to store, cannot break or chip, they take less space in the refrigerator, chill more quickly, and are safe for the children to handle.

The future of canned beverage sales is extremely bright. Indications are that during 1959 canned carbonated beverages will be more actively promoted than ever before.

During the last few years, home mass-markets have opened for hundreds of canned products. Just as they have become a part of modern living, so too, will canned soft drinks. Retailers can speed the process and their profits by pitching up their canned soft drink line.

Remember, the idea of canned soft drinks is new to many of your customers. Give these beverages more — and better — display space. Feature them prominently in your ads and point-of-sale material. If bottles and cans are given proportional place in the market, cans will bring plus sales.

SUMMER FAVORITE. There's nothing so welcoming as a can cold as the [illegible] pick-me-up of an ice-cold soft drink. Most people enjoy the added convenience that canned beverages offer in coolers, picnics and large refrigerator space. For retailers, sales and more profits go to those who [illegible] variety of flavors and keep wide choice for extra coolers.



SIZING

SAMPLES AID SALES. To introduce canned soft drinks, the Food Land Market in Seattle, Washington, arranged for chain-wide tastings. Bottles of soft drinks were served [illegible] set up [illegible] demonstrators [illegible] shoppers [illegible] to sample.

PLEASE ALL TASTES

For instance, the magazine states that of the leading soft-drink processors, 19 out of 25 are now using cans to some extent. These firms include such well-known names as Coca-Cola, Pepsi-Cola, Canada Dry, 7-Up, Nehi, Hires, Dr. Pepper, Cott, Mission Dry, Hoffman, Chequot Club, White Rock and Mason.

Nehi Corp., the No. 1 U.S. canner, reports that 1956 can sales exceeded 1955 by 50%. Shasta Water Company, a West Coast bottler, reports that sales for the year preceding their change to cans were $543,000. Present sales are more than $2 million. And, results achieved by a promotion-minded franchiser in North Carolina shows an increase in total can sales of 98.8% in '56 over '55 in a 19-city area.

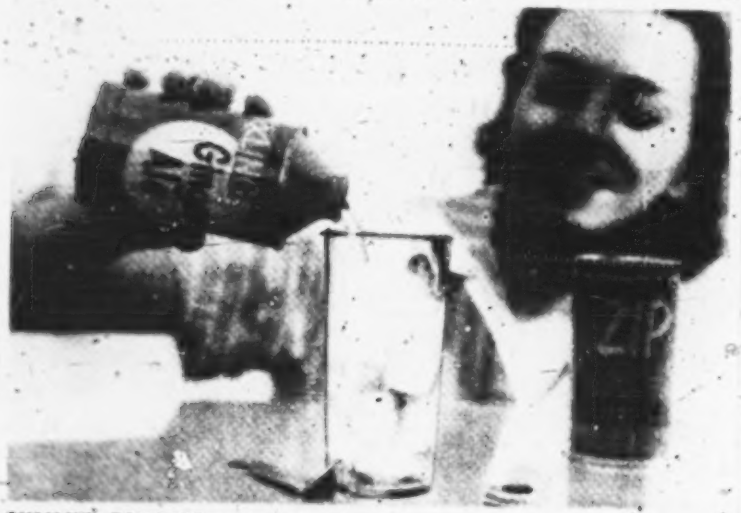
Bottlers were not the only ones to benefit from the switch to canned soft drinks. Retailers, too, reported amazing increases. The "Food Processing" article cites an A&P survey in 19 of its outlets in Charlotte, North Carolina, to prove this. The survey reveals that canned soft drink sales increased 280% in 1956 over 1955 while sales of bottled beverages rose only 66% during the same period.

Favorable consumer reaction to canned beverages is based on a number of factors. Foremost among them is the willingness to pay for the convenience represented by canned beverages — they're easy to use, easy to store, cannot break or chip, they take less space in the refrigerator, chill more quickly, and are safe for the children to handle.

The future of canned beverages looks extremely bright. Indications are that during 1957 canned carbonated beverages will be more actively promoted than ever before.

During the last few generations, huge mass markets have opened for hundreds of canned products. Just as they have become a part of modern living, so, too, will canned soft drinks. Retailers can speed the process and their profits by playing up their canned soft drink line!

Remember, the idea of canned soft drinks is new to many of your customers. Give these beverages more — and better — display space. Feature them prominently in your ads and point-of-sale material. If bottles and cans are given proportional place in the market, cans will bring plus sales.



SUMMER FAVORITE. There's nothing so welcome on a sultry day as the refreshing pick-up of an ice-cold soft drink. More people every day are discovering that their favorite flavor in cans chills quickly and takes less refrigerator space. For greater sales — and more profits too — be sure to feature a variety of flavors and keep some chilled for extra customer convenience.

SAMPLES AID SALES. To introduce canned soft drinks, the Foodland Market in Seattle, Washington, arranged for a demonstrator from a local bottler to pass out free samples. The drinks were served cold from an ice bin set up for just this purpose. Notice, too, that a mass display of canned beverages was set up near the demonstrator so that shoppers would be tempted to buy on the spot.

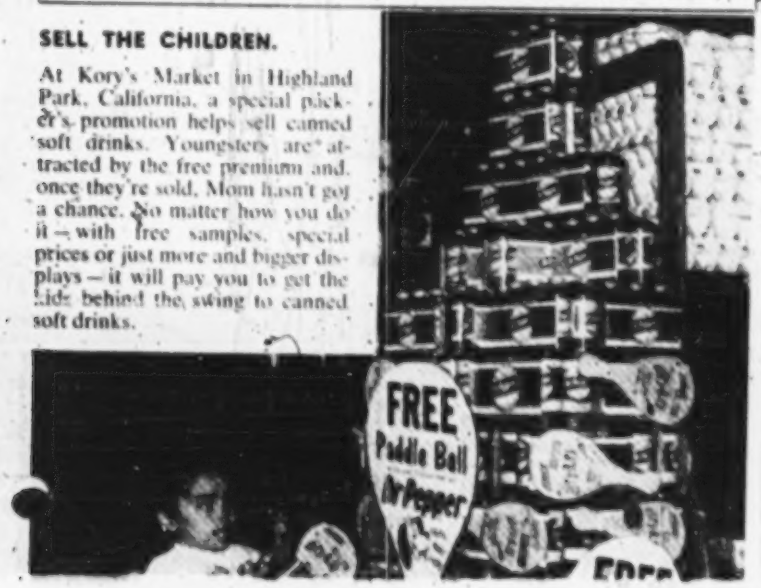
SIZING UP SALES. Here's a sure sign shoppers go for canned soft drinks in a big way. Foodland Markets in Dearborn, Michigan, is pushing full quarts of canned root beer — via stacks of cut-away cases given their own floor space. If consumers go for this large size you can bet they go for soft drinks in cans.

PLEASE ALL TASTES. Variety is the keynote of this 42-case canned soft drink display being restocked by Clerk John Diroff at the Thriftymart Market, Eagle Rock, California. Featured are such flavor favorites as Black Cherry, Orange, Lemon-Lime, Ginger Ale, Root Beer and Cola. There's enough variety here to make it easy for Mrs. Housewife to satisfy the tastes of all members of her family. Cans are priced in units of **six** to encourage multiple purchases.

TEMPTING TIE-INS. Customers are lured into stocking up for outdoor eating and fun by this eye-catching display in the Sentry Store at Thiensville, Wisconsin. Next to the canned beer and potato chips is a display of equipment for cooking and grilling. It's a good idea to make canned beer an integral part of any picnic display you set up.

SELL THE CHILDREN.

At Kory's Market in Highland Park, California, a special pick-er's promotion helps sell canned soft drinks. Youngsters are attracted by the free premium and, once they're sold, Mom hasn't got a chance. No matter how you do it—with free samples, special prices or just more and bigger displays—it will pay you to get the kids behind the swing to canned soft drinks.



PROMOTION POINTERS

This young lady points the way to extra profits for retailers who push canned sauerkraut this summer! To take advantage of the 24% retail profit margin on kraut, tie-in with the "Kraut Salad Season" promotion sponsored by the National Kraut Packers Association. New and appetizing recipes are being presented to your customers through a national publicity program. Set up combination displays of kraut and dressings in your produce section or load up a shopping cart with kraut and tie it in with your cold cut department for a mobile jumble display.

This year's "National Canned Salmon Week" will be promoted from August 23-30 and will coincide with the arrival of new packs of canned salmon from Alaska, Columbia River and Puget Sound canneries. "Summer Salad Specials" is the theme of the 1957 campaign. Food editors of newspapers, television and radio have been alerted to the promotion with timely canned salmon recipe material.

A free page color mat is available to retailers to use for a regular advertising page. "Summer Salad Specials" is the banner headline of the mat which also features an appetite-building canned salmon salad plate in full color. Herald A. O'Neill (left), executive secretary, Association of Pacific Fisheries, Inc., and L. A. Peterson, chairman of the salmon industry committee for "National Canned Salmon Week," are shown as they viewed the layout of the full-color advertising page. For a copy of the mat, write to Association of Pacific Fisheries, 200 Colman Building, Seattle 4, Washington.

REMINDER

You still have a few weeks to plan your display, advertising and merchandising tie-ins with one of the biggest store-wide food promotions to hit the grocery trade. The campaign, starting September 12th and continuing through the 21st, is a joint promotional effort of the National Association of Retail Grocers and "Saturday Evening Post" magazine. Theme of this promotion is

CANNED FOODS

Merchandiser Digest

STOCK UP. This display of canned soft drinks at Art's Food Center in Seattle, Washington, is located next to the refrigerated cases. Shoppers, picking up a cold beverage for immediate use, are encouraged to stock up on extra cans. They are so arranged that each of the different flavors can be easily reached. A homemade sign lists the advantages of soft drinks in cans.

MOVES WITH TRAFFIC. At the Grand Central Market, San Francisco, California, they figure that the more shoppers are exposed to canned soft drinks, the quicker they'll try them. By using dump displays in movable wire baskets, they can be moved quickly to where traffic is heaviest. You can use similar baskets and set them up in your picnic department, cold cuts section, regular meat department or at the checkout to encourage last-minute purchases.

KEEP YOUR EYE ON THE THERMOMETER. There's still lots of hot weather ahead, so keep your eye on the thermometer and be ready with plenty of "keep cool" promotions. Include in your displays soft drinks and juices – canned items that lend themselves to summertime merchandising. In your advertising, handbills or store banners, you might invite shoppers to come in and cool off with a free sample of canned soft drinks.

Foods-in-glass NEWS

a memo to Home Economists

FROM [illegible] CAP COMPANY • CHICAGO
A Subsidiary of Continental Can Company, Inc.

Vol. II, No. 4 June 1957

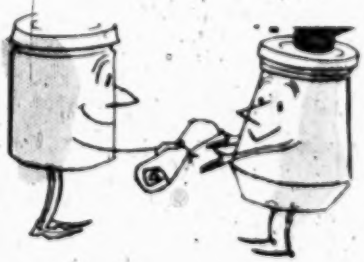
WHAT A YEAR THIS HAS BEEN!

Busy, busy, busy...that's what we've been, but we love it! We've particularly enjoyed telling all of our home economist friends about the new twist-off cap, which has been such a sensation since its introduction to the food industry. Most of you who receive this newsletter regularly are familiar with our two pets, Mr. Twist-Off and Mr. Pry-Off. We know, though, that you've been busy, too, and may have forgotten some of the facts we've been sending to you. So, with your permission, we'd like to repeat a few facts, for your information, covered in previous newsletters.

• • •

COMMENCEMENT EXCERCISES...

This has been the time for them and we thought we'd commence by telling you that Mr. Twist-Off Cap, a real infant prodigy, has been tops in his class and rates right up there in popularity with his older brother, Mr. Pry-Off Cap, as a seal for glass containers.



Just in case we missed giving you all the facts on these two favorites, we gave ourselves a sort of "final examination" and we thought you might like to see it. Perhaps it will come in handy as reference material or even as a quiz for a class next fall.

IMPULSE! sparks point-of-purchase buying!

IMPROVEMENT! brings you the newest in glass!

Whether you pack food or beverage, your product will benefit from the efforts of the three Hazel-Atlas "Imps"! It will get more sales *impact*, and produce more *impulse* sales in the beautiful H-A containers. 1. New H-A wine bottles are *crystal-ribbed* at shoulder and base to capture light and color... make wine come alive on the shelf. 2. New H-A Permalabel cosmetic bottles and jars made in beautiful flint, amber, blue and opal white glass. New H-A Permalabel cosmetic items have brilliant colors permanently fired into the glass.

For distilled spirits, Hazel-Atlas also offers a full line of standard packages... lightweight, glamour-in-glass bottles of crystal-clear flint and beautiful amber, available in every popular style and size.

For your peanut butter, cheese, and spreads there is a complete H-A line of beautiful decorated and plain re-use tumblers as well as other items for table use. Sparkling flint jars for baby foods, preserves, relish, olives and pickles, honey, vegetables and fruit. Beautiful, crystal-clear bottles for salad dressings, mayonnaise and catsup. Rigid quality-controls keep your H-A containers uniform in size, shape, clarity and color. They perform efficiently on the filling line and display your product at its best. You are sure of fast, dependable delivery during sales peaks and emergencies, served by H-A's nationwide network of glass plants and warehouses. Ask your H-A representative or call your nearest H-A office, today.

WHEELING, WEST VIRGINIA

HERE'S THE CAP TEST...

Q. What is vapor-vacuum sealing?

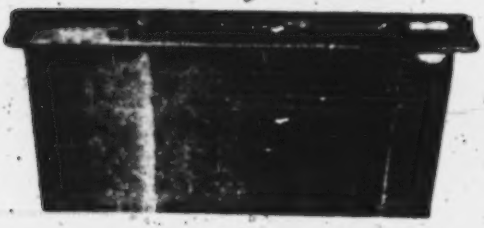
A. A method for sealing glass containers for food to protect the contents from air. During the capping process, air is forced out of the jar or bottle with dry steam. After sealing, the steam condenses, creating a vacuum in the top of the container. The gasket in the cap prevents air from leaking in.

Q. Why is it necessary to protect food from contact with the air?

A. Because of its oxidizing effect, air is the great destroyer of freshness and color in food. Also, many molds which have a contaminating effect upon food are airborne.

Q. What is the pry-off cap?

A. A pry-off cap is a machine-applied metal lid. A flexible gasket on the inside of the lid forced against the side of the container forms an airtight seal, preventing leakage of air. This provides lasting protection for the food.



Q. What is a twist-off cap?

A. The new twist-off cap has a gasket in the top which provides the airtight seal. Lugs on the inside of the cap fit snugly under lugs on the neck or outer rim of the glass container. A quarter-turn of the cap brings the top of the jar or bottle tight against the flexible gasket to create a seal.

Q. Are pry-off and twist-off caps easy to open?

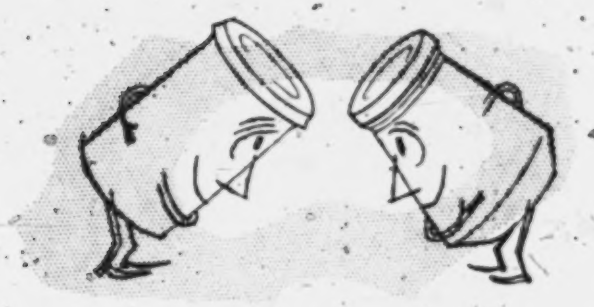
A. Either can be removed easily. A flick of the wrist with a lid flipper, a handy metal key designed for the purpose, will open the pry-off. The twist-off is removed by hand with a quarter turn of the cap.

Q. Can the caps be used to reseal containers?

A. If the contents are not consumed at one sitting, the original cap can be used to reseal the container, airtight. Pressing down on the pry-off with the heels of the hands until a click is heard restores the airtight seal. A twist of the twist-off cap puts it snugly in place protecting the contents from air. For most food products, refrigeration of the unused contents is necessary, as well.

Q. Can each cap be used on all foods packed in glass?

A. Generally speaking, no. Each has its own job to do. The pry-off is recommended for foods which undergo high retorting temperatures (240 degrees or more), including many vegetables, baby food, and various meat products. The twist-off is ideal for products packed at sterile temperatures, cold-filled products, or foods that are pasteurized by open-water bath. Products packed by these various methods include pickles, catsup, vinegar, cherries, syrup, and others. Some foods, such as jams, jellies, preserves, and peanut butter, use both -- the pry-off if packed in tumblers -- the twist-off if packed in jars. Many packers of sterile fruit juices use the pry-off on pints, quarts, and gallons, but prefer the twist-off for decanter-style packages.



Q. Why is glass an ideal container for food?

A. An inert, non-toxic material, glass can not affect the taste, aroma, color, purity, or chemical structure of food. Protected from air, food will keep indefinitely in glass. Glass also affords an opportunity to see the color, consistency, and shape of the products.

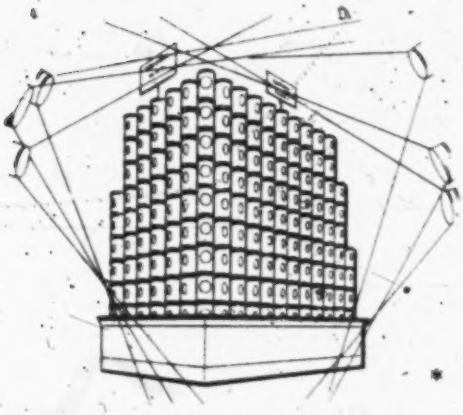
Canned Foods Newsletter for Brokers—May 1958

"We at National like canned foods because no other commodity group produces as much dollar income in our stores, and none produces as much gross profit. They account for about one-sixth of our total volume and earn a percentage profit higher than our average.

"Canned foods have built-in advantages which cannot be matched by any other method of processing: finest quality, unequalled flavor, nutritious, convenient, economical, time and work saving, ready for instant use, little or no waste, clean and wholesome, wide variety, easy to buy, store and use, available in all seasons."

Val S. Bauman, Vice President
National Tea Company

* * *



Canned foods benefit most from special promotions — unit sales of canned vegetables went from 4,038 in regular sales to 34,539 in one week from special display. Canned fruits jumped from 3,008 to 24,475.

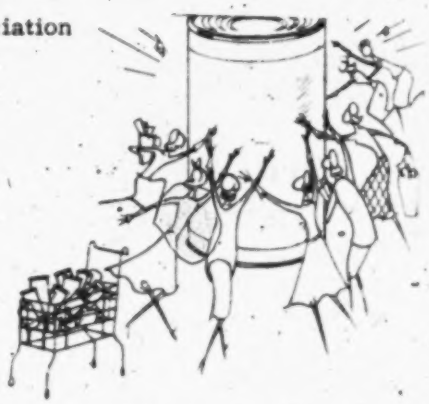
CANNED FOOD FACTS

from the
National Canners Association

Each week some 50 million shoppers purchase about 400 million containers of canned foods in grocery stores and other market outlets in cities, towns and communities of all sizes throughout the United States. About $85 million is spent each week by U. S. consumers for canned foods, of which there are more than 500 different types and styles available.



* * *

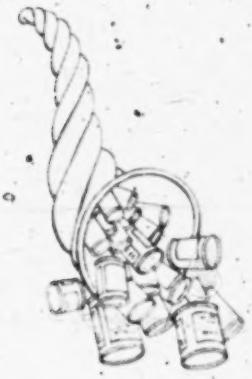
CONTINENTAL CAN COMPANY

Another attribute of canned foods that is important to the consumer is their relatively stable price. The U. S. Bureau of Labor Statistics consumer price index reveals that canned foods have been consistently in the "best buy" group of all food products.

* * *

Canned foods have been in the forefront of many of the new developments in the food marketing operation. Canned foods were the first of the so-called "pre-packaged" foods and the first of the "convenience" foods. As such, they have been the backbone of most retail store operations. Canned foods account for 15 to 20 percent of the total sales in many grocery stores.

* * *



Week after week and year after year the homemaker goes to the store knowing that there she will find a complete assortment of canned foods of unquestioned purity, wholesomeness and palatability. Each year, some new kinds of canned foods are added to the list, so that at all times she has a wide assortment of fruits, vegetables, fish, meats, poultry, soups, juices and specialties. The greater variety of canned entrees, salads, desserts, and foods for special purposes, such as the dietetic, infant, junior age and senior foods, provide all members of the family a pleasing variety with a minimum of time and work expended.

* * *

Production of canned foods has increased 20-fold in the last 50 years, a gain that few American industries can match and an indisputable indication of consumer acceptance of this form of food. The annual production of the canning industry now amounts to more than 22 billion pounds, representing about 8-1/2% of the nation's food supply. This is packed in 700 million cases containing more than 22 billion tin and glass containers.

* * *

ALTHOUGH THE MODERN GROCERY STOCKS ANYWHERE FROM 3,000 to 8,000 ITEMS, ALERT RETAILERS KNOW THAT THE BACKBONE OF THEIR SALES IS STILL THE CANNED FOODS DEPARTMENT WHICH YIELDS A HIGHER NET PROFIT THAN ALMOST ANY OTHER CLASS OF MERCHANDISE.

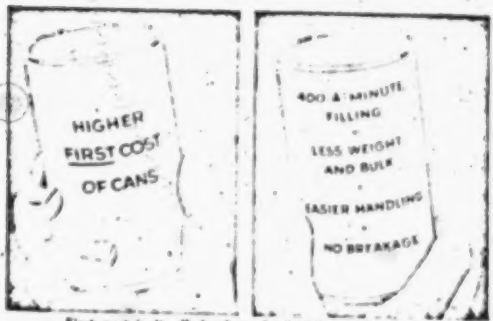
What leading brewers know about canned beer

Some of the most successful national brewers now pack almost half their beer in cans. Alert regional brewers are also stepping up their canned beer output.

Modern cost accounting reveals the true economy of cans in both large and local operations. Cans cost far less to fill, deliver and handle than less convenient containers. They take less space. There's no breakage, and no need for expensive packing cases. Sell more of your beer the way modern people like it—in Continental cans.



First cost isn't all. Look at both sides of the packaging picture to appreciate the economy of cans.

DESIGN 'POP' BOTTLE CAN

NEW YORK, July 7—(AP)—Continental Can Co. announced plans Thursday for production of a streamlined soft drink can that's shaped like a "pop" bottle.

The slender can is approximately the same diameter as the conventional six or seven-ounce soft drink bottle of glass and just about as tall, but it holds more (nine ounces).

The company says it can be used in most automatic vending machines and can be merchandised in the same six-pack carrier now used for returnable bottles.

'POP' BOTTLE SHAPED CANS ARE PLANNED

NEW YORK (AP)—Continental Can Co. announced plans today for production of a streamlined soft drink can that's shaped like a "pop" bottle.

The slender can is approximately the same diameter as the conventional glass 6 or 7-ounce soft drink bottle and just about as tall, but holds nine ounces. The company says it can be used in most automatic vending machines and can be merchandised in the same six-pack carrier now used for returnable bottles.

Continental To Make New Soft Drink Can

NEW YORK, July 7.—Continental Can Company will start production in July of a new, nine-ounce, cap sealed soft drink can. The nearest thing to a bottle, this slender can is approximately the same diameter as a standard six-ounce or seven-ounce soft drink bottle and closely approximates it in height.

Because of its dimensions, the new can may be run through present bottling equipment with minimum modifications and can be used in most automatic vending machines without any major adjustments to the machine. It also can be merchandised in the same six-pack carrier now used for returnable bottles.

Burnam & Morrill Company
Main Canned Foods

Mr. J. C. Neuhart
Wheeling

Dear Sir:

Mr. B. Thomas Giesey and the writer were in Portland last week calling on Burnham & Morrill and Maine Canned Foods. As you know, Bert has already made a deal with Maine Canned Foods for twenty-five cars of small size bean pots, and approval of the model should come through today or tomorrow.

One thing we learned, however, that may be of interest to you. Mr. Thayer, of Burnham & Morrill told us that Anchor-Hocking and Armstrong Glass did not raise their prices 7¾% April 1st. Burnham & Morrill advised Anchor-Hocking and Armstrong that if the full increase in price was put into effect that it would cut down on the use of glass as it would be too far out of line with the cost of their tin package. As a result, Anchor-Hocking and Armstrong gave them an increase in price that amounted to approximately 2% or around 8¢ per gross. We haven't any of this business at the present time, but I haven't any doubt but what Bert is going to get some in the near future. You will undoubtedly want to meet these prices, and we can get the exact price at any time, but the fact remains that Maine Canned Foods also knows that Burnham & Morrill did not receive the full increase of 7¾%, and this will undoubtedly cause complications.

We have promised Maine Canned Foods that we will

start shipping glass to them in August providing they gave us approval of the new model this week.

This will probably not affect us until that time, but we are splitting this business with Owens-Illinois, and somewhere along the line, an adjustment in price will undoubtedly have to be made. No doubt, Maine Canned Foods will [fol. 1285] take this up with Owens-Illinois before we start shipping them in August, and we can be guided by what they do.

Very truly yours, E. P. Williams.

EPW:amw

[fol. 1286] GOVERNMENT'S EXHIBIT 775

Philadelphia, Pa.

April 5, 1954.

Mr. J. S. Algeo
Subject: Second Quarter Prospects

With reference to your letter of April 1st.

We have found considerable resentment in some quarters over the recent price advance.

One of our fountain topping accounts was particularly incensed and said that any business that could be swung over to tin would be fully explored, and if possible the change would be made. This manufacturer packs marshmallow, chocolate syrup, walnuts in syrup, cherries and pineapple.

Another packer, a pickle concern, although they anticipated the increase with a half dozen truckloads, advised that the increase in the glass price is making their profit margin very slim. This will force them to go to sources who will give a concession in price, people who are getting into the wide mouth business, such as Gaynor, and other suppliers, who in the past have given special figures on volume orders, people such as Knox and Lummus.

A third concern, which packs a seafood in a private mold item, is distressed because the retail ceiling for the item cannot be increased without a corresponding loss in sales. It is a specialty item which can be eliminated from a family budget if the price gets too high. In this case, the packer feels that it is impossible to pass the increase along to the

consumer, and in view of the fact that their profit margin is not great now, they have told us that they may be forced to look for substitute material for their product.

The jobbing trade which we cover, that is bottle and jar jobbers, are not concerned because such increases are automatically passed along to their trade.

As regards the outlook, we have been unable to get any great amount of information as to what packers feel will happen in the coming months. There are so many cross currents in business that most of them are afraid to make any predictions. On the one hand commodities are going up and unemployment is increasing, so the people we have talked to are confused.

[fol. 1287] In Philadelphia there is considerable unemployment, particularly in the heavy industries, and what comments we have been able to develop have brought out this fact, with the feeling that it will affect specialty items, such as pickles, olives, mayonnaise, etc. adversely, as those people who are unemployed feel the increasing pinch of their lack of income.

We cover a considerable number of bar and restaurant jobbing houses. These people have been seriously concerned with business falling off for several months, particularly the bar supply houses. The taprooms in Philadelphia are not doing the business they did last year. This again goes back to the increased unemployment. There have been many attempts to compensate for higher costs in this line by decreasing the capacity of the tumblers used for wine, beer and liquor, but these capacities have now reached such small sizes, that is ½ oz. for whiskey, 3 oz. for wine and 4½ oz. and 5 oz. for beer, that this practice cannot be continued much longer.

One field which shows signs of increased activity, and this usually has happened when business in general is off, is the premium business. We have had a slight, but definite, increase in interest, as well as sale of promotional items, such as Moderntone Sets and other tableware. This has come from department and appliance stores.

The one comment that we can pass on to you is that in this area the people we have contacted are uncertain as to what to expect during the balance of the year.

Yours truly, F. C. Menair.

FCMb

[fol. 1288] GOVERNMENT'S EXHIBIT 776

Philadelphia, Pa.

May 5, 1954.

Mr. J. S. Algeo:—

For what it may concern you, I talked to a lawyer to-day whose firm represented a group of merchants in the food packing line that had grouped together as an association to try to get to the bottom of the recent price advance made by most of the glass companies. This was thoroughly discussed with quite a large clientele of Hazel-Atlas and all were in the food industry. They did not tell me where the meeting was held.

He would not tell me what group they did represent, but at this meeting they came to the conclusion amongst themselves that the increase in prices was not warranted at this time. It seems they checked very carefully all the statements of the larger companies, and while I am not commenting on their findings because I do not think they are accurate, their conclusion was they had been taken advantage of and that they were all working along a certain line to try to get some of the glass companies to rescind this advance or turn to some other kind of packaging.

Do not ask me anymore than this; I cannot divulge who told me, nor who the group was.

I know you are going to censure me for this, but I have been put on my strict word not to tell.

I was told further I could write this letter which I am putting above.

Yours very truly, Robert B. Reinhart.

All Agents,

It was suggested that I send to each of our agencies the remarks which I made at the Canners Convention at Atlantic City. This letter was intended to give a short summary of some of the important matters that have taken place in the last year. I hope it may be of some value to you.

Yours truly, J. S. Algeo, Vice Pres. & General Sales Manager.

JSA/ec

[fol. 1290] Canners Convention—January 25, 1954

A year ago most of the remarks I made to you had to do with handicaps under which we were suffering, and some of the steps that we had in mind toward overcoming those handicaps. I told you we intended building a plant in the Chicago area and another in the New York area and that we expected at that time to have the Chicago plant in operation in 1954. Unfortunately, the building of the Chicago, or Plainfield plant has been deferred due to the fact that the estimated cost was far far greater than we had in mind, and we thought we had a pretty fair idea as to what a plant would cost. The idea of building the Plainfield plant has not been abandoned—it will be built and we are beginning to figure again. In the meantime, we had an opportunity of making a deal for the Gas City plant of the Knox Glass Bottle Company. We took an option on the plant but for several reasons this deal has fallen through. Even had we purchased the Gas City plant, we would not have abandoned the idea of building at Plainfield later on.

In the past year, as a prelimimary to expanding our operations in New York and Chicago, we have rented warehouses at Kearny in the vicinity of New York, at Chester in the vicinity of Philadelphia, and at Rockdale in the vicinity of Chicago. These warehouses have largely served the purpose for which they were intended and, we believe, have

enabled us to retain some business which we otherwise would have lost, and to have picked up some new accounts. These warehouses, however, are stop-gaps and will undoubtedly be abandoned when plants are built in those areas. We have no specific plans for further expansion at the moment except at Plainfield. We have, however, built a new warehouse at Montgomery, a new warehouse at Clarksburg, and expect to soon build another warehouse at Oakland. Our long term plans for expansion of productive facilities have not been abandoned.

We have added to our decorating facilities at Clarksburg and are now in position to decorate as much ware as our capacity for making blanks. There is no need for further expansion of these decorating facilities unless these is a corresponding increase in our capacity for producing. This means that we are now in position to give excellent service on decorated ware at Clarksburg. If any delays are encountered, they probably will be due to lack of blanks rather than lack of ability to decorate. The quality of our decorations at Clarksburg is unsurpassed. We can take care of more business than we now have.

Last year I spoke of our handicap in not having business in certain fields—for instance, in the carbonated beverage field and in the amber field. Last year we wrote you that we would take on some carbonated beverage bottle business, not in a big way but sufficiently to enable us to get our feet wet, so to speak. We have some little progress. The bottles we have furnished have been very satisfactory so we no longer have fear that we may not make good in that field. We want you to solicit this business but on a selective basis. One of our great handicaps is the fact that most returnable beverage bottles are decorated and we don't have decorating facilities at the plants which would make the bottles. On the other hand, the usage of one trip beverage bottles is increasing rapidly. These bottles are not decorated. Therefore, we are not under any handicap so far as decorating is concerned.

I spoke of our handicap with reference to amber business. For years we have been operating one amber tank continuously and the second tank spasmodically. We have been trying hard during the past year to build up sufficient volume to justify two tank operation. We have made pro-

gress but we don't have sufficient business as yet. Before last year we had not been in position to make amber jars. We are trying to develop enough jar business to keep one machine in operation and again we have made progress, but not enough. We want amber jar business.

[fol. 1291] At last year's meeting the matter of quality was discussed and I told you we would make progress. I doubt whether the record would show that progress has been made, but actually we have made progress and I feel confident that the results this year will clearly show the improvement. Last year we had entirely too many avoidable complaints. I am sure a lot of these will be eliminated. On the whole, we make a good quality of merchandise but most of our troubles should never have occurred. I am sure that the steps we have taken and are taking will bring about a correction.

Last year I emphasized the fact that our real trouble was due to the fact that prices on the whole were too low in relationship to costs. We advanced prices April last year by about 7½ percent and I think I told you that that advance would not be sufficient to offset the cost increases which had already taken place and those which we could definitely foresee. This prediction turned out to be true. While our sales last year increased approximately twelve percent, our profit increased only moderately. In other words, our percent of profit on sales was less than it was in 1952. This price situation still confronts us. Costs continue to rise all last year. Labor rates in certain divisions increased in September; fuel increased. Our labor negotiations covering most of our employees begin the middle of February. It is a foregone conclusion that a substantial increase will have to be made. It isn't a question of whether or not to grant an increase, but rather a question of keeping the increase down to the minimum. Our price advance last April didn't quite cover cost increases which had taken place since that time. Since then many substantial increases have taken place and we are faced with a real big increase which will become effective about April first. All this means that we have got to have further prices advances. We must increase our prices April first. How much we can get we don't know of course, but we must get a fair advance. We don't believe you should go out and

voluntarily publicize the fact that we expect to make increases April first, but most certainly if the customer asks you about the possibility of an advance, you should give him the facts and not be hesitant in doing so. There are only two ways to recover cost increases—one is by higher prices and the other is by increased effeciency. Our effeciency is constantly increasing but for years our costs have increased faster than our ability to increase efficiency. It is up to all of us to do his utmost to get the increase when and if it is announced.

It is pretty risky to prophecy as to the future course of business. We are moderately optimistic as to prospects for this year. We see nothing on the horizon which would bring about a pronounced recession. We are fairly well pleased with incoming business so far this year and we see no reason why this year should not be approximately as good as in 1953.

JSA.

Government's Exhibit 785

Question 10

Acquisitions by Continental Can Company, Inc.

1942–1956

Vendor	Date Acquired	Form of Acquisition	Product Line	Consideration		Information Furnished to the Government
*Square Star Can Company St. Louis, Mo.	8/ 1/42	assets	composite containers (paper cans with metal ends)	cash:	$62,072.17	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
Gardner-Richardson Company Middletown, Ohio	8/27/42	assets	composite containers (paper cans with metal ends)	cash:	$158,500.00	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
Boothby Fibre Can Company Boston, Mass.	11/ 6/42	assets	paper containers	cash:	$170,770.50	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
The Container Company Van Wert, Ohio	12/20/42	stock	fibre drums	cash:	$1,762,700.00	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
Fonda Container Company Utica, N. Y.	12/21/42	assets	paper containers	cash:	$39,449.86	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.

* In late 1951 Continental's Paper Division discontinued production of composite containers.

[fol. 1293]

Vendor	Date Acquired	Form of Acquisition	Product Line	Consideration		Information Furnished to the Government
Val Vita Food Products Co. Fullerton, Cal.	2/23/43	assets	metal cans	cash:	$1,418,862.18	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
Standard Containers, Inc. Rockaway, N. J.	3/17/43	assets	fibre drums	cash:	$202,922.59	
* Marco Chemicals, Inc. Sewaren, N. J.	7/14/43	minority stock interest	synthetic resins, plastics	cash:	$130,000.00	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
Bond Manufacturing Corporation, Inc. Wilmington, Del.	1/ 5/44	stock	crown caps and cork products	cash:	$4,500,000.00	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
Keystone Drum Company Charleroi, Pa.	5/26/44	stock	fibre drums	cash:	$225,000.00	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
** Reynolds Molded Plastics Division of Reynolds Spring Company Cambridge, Ohio	5/15/44	assets	molded plastics	cash:	$972,920.85	
Cameron Can Machinery Corporation Chicago, Ill.	7/ 7/44	stock	can making and other machinery and equipment	cash:	$4,000,000.00	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.

* Interest sold in 1952.

** Molded plastics line discontinued in 1952, and "conolite", which had been added to operations, was continued. Plant was sold when operation was moved to Milwaukee.

[fol. 1294]

Vendor	Date Acquired	Form of Acquisition	Product Line	Consideration	Information Furnished to the Government
Standwood Fibre Tube & Paper Corporation North Bergen, N. J.	5/ 1/44	assets	composite containers	cash: $60,763.66	
Mono-Service Company Newark, N. J.	9/30/44	stock: then assets on liquidation	paper cups and containers	7,334 shares of Mono-Service Co. stock at $300.00 per share and $799,800.00 in cash. Total value paid: $3,000,000.00	Reported in detail, as requested, to F.T.C. in letter dated April 22, 1946.
Owens-Illinois Can Co. Chicago, Ill.	10/31/44	assets	metal cans, steel pails, decorated kitchenware, specialty containers	cash: $7,500,000.00	(a) On information furnished the Department of Justice, Mr. Tom Clark, Assistant Attorney General, granted clearance in letter dated August 28, 1943 (b) Reported in detail, as requested, to the F.T.C. in letter dated April 22, 1946.
* Gould Paper Company Lyons Falls, N. Y.	9/ 5/45	stock	paper specialties, high grade white papers and newsprint	cash: $2,880,000.00	
Bamberger-Kraus Company and Estate of B. F. Kraus Pittsburgh, Pa.	10/ 1/45	stock	crown caps	cash: $500,000.00	

* Continental sold Gould Paper Company on June 21, 1951 to R. W. Luethi.

Willkie Owen Otis Farr & Gallagher
15 Broad Street
New York

February 20, 1946.

William H. England, Esq.
Director, Division of Accounts,
Statistics & Economic Investigations,
Federal Trade Commission,
Washington, D. C.

Re: Continental Can Company, Inc.

Dear Mr. England:

Continental Can Company, our client, has referred to me your letter of February 11, requesting that it furnish information as to the acquisition of stock or assets of a number of companies over the past years. The Company has every desire to cooperate with the Commission in furnishing so much of the information as is available, but at the outset we should advise you that it will be totally impossible to furnish this information by the end of February, as you request at the end of the letter. Incidentally, your letter, although dated February 11, was not posted until February 18, and received by the Company on the 19th. You will appreciate that the information requested will require exhaustive research through old records, many of which are, if available at all, in dead storage, and that it would be an impossible task to complete the survey even at top speed, in our opinion, in less than three or four months.

I will be glad to confer with you on some reasonable program of supplying the information, but if it is needed by you only if furnished by the end of the month, we cannot [fol. 1299] possibly supply it within that time.

Will you let me hear from you on this subject.

Very truly yours, H. Bartow Farr

HBF:MMC

[fol. 1300] Continental Can Company, Inc.
100 East 42nd Street
New York 17, N. Y.

To the Federal Trade Commission, April 22, 1946.
Washington, D. C.

Attention of William A. England, Esq., Director of Division of Accounts, Statistics and Economic Investigations.

Dear Sirs:

Continental Can Company, Inc. (hereinafter referred to as "Continental") herewith furnishes the information requested by the Commission in its letter of February 11, 1946. In connection with this study, the company was requested as to each acquisition to give a "statement of the circumstances or situation that led up to the acquisition."

In this reply, the company has condensed this statement to set forth the primary factors. However, it should be mentioned that as to all the acquisitions there was the following background, which has not been repeated throughout the answer, but which is nevertheless present in each case to a greater or lesser degree:

At the time that Continental was organized, the American Can Company was well established in the industry as the dominant can-making company. The growth of Continental through natural expansion and through the acquisition of the companies referred to in the questionnaire had the purpose and effect of building up competition in the industry through the strengthening of Continental, which is now the second largest manufacturer of cans in the country.

[fol. 1301] In only a few cases, and then to a minor extent as pointed out hereafter, was there any competition between Continental and the company so acquired. In such instances competition in the industry was never lessened by such acquisition, but was vigorously continued and expanded under the efficient management of Continental. It was recognized in the Federal Courts in the early days that the American Can's domination threatened to create a monopoly. See *U. S.* v. *American Can*, 230 Fed. 859; 231 Fed. 1019; appeal dismissed 256 U. S. 706.

That this situation no longer exists is in great measure due to the important competitive position that Continental has built up in the industry, primarily through the acquisitions hereafter referred to, as has been frequently recognized by the Department of Justice.

It should also be emphasized that as the company's business expanded these additional acquisitions were necessary to meet the competition of others in servicing the national accounts that had thus been acquired.

With this basic explanation, we now furnish below the information requested by the Commission, in so far as it is available.

Organization

Continental is a New York corporation chartered January 17, 1913. It was organized to acquire all the interests of (a) the Continental Can Company, a New Jersey corporation, (b) the Export and Domestic Can Company, a New York corporation, and (c) the Standard Tin Plate Company, a Pennsylvania corporation. These properties [fol. 1302] were acquired on January 24, 1913.

The Continental Can Company (of New Jersey) and the Export and Domestic Can Company had been established in 1904 and 1905, respectively. The companies operated plants at New York City, Syracuse, Baltimore, Canonsburg, Pennsylvania and Chicago. The terms of the acquisition were that Continental Can Company of New Jersey sold to Continental of New York all its property, rights and franchises for $3,341,747.87 of 7% preferred stock, $7,129,062.10 of common stock and $172,164.28 in cash. Export and Domestic Can Company sold to Continental of New York all its property, rights and franchises for $408,252.13 of 7% preferred stock, $870,937.90 of common stock and $21,081.34 in cash. The capital stock of the Standard Tin Plate Company was owned by Continental Can Company of New Jersey and was included in the assets purchased from it.

Continental initially had its principal office and kept its records in Syracuse, New York. Because of a flood in the Company's offices there in the winter of 1919-20 many of the old records of the company were destroyed. Among these were the balance sheets of the above mentioned enterprises at the date of acquisition, and their income state-

ments for the three full years of operation preceding the dates of acquisition. Accordingly they cannot be located. However, there is annexed hereto as Exhibit 1, a consolidated balance sheet showing the position of Continental as of December 2, 1912 after the issuance of its capital stock and the acquisition of the assets and liabilities of the Continental Can Company of New Jersey, the Export and Domestic Can Company of New York and the Stand-[fol. 1303] ard Tin Plate Company of Canonsburg, Pennsylvania, together with a brief description of the operations of these companies, contained in circular dated January 28, 1913.

Apparently the only container manufacturing enterprise acquired thereafter by Continental prior to 1926 was the National Can Company, on August 20, 1923. This company was located at Detroit, Michigan, and was engaged there in the manufacture of metal containers. Terms of the acquisition were that the land, buildings, machinery and equipment were purchased for $350,000 and the inventory purchased for $112,248.17. A balance sheet and income statements of this enterprise are no longer available.

Information requested by the last paragraph of page 1, and the first two paragraphs of page 2 of the Commission's letter is now set forth in the same numerical order as appears therein.

No. 1

Los Angeles Can Company

On December 6, 1926 Continental purchased machinery, equipment and inventories of this Company for $585,000 in cash. The company's only plant was located at Los Angeles, California, and it was engaged in the manufacture of metal containers.

The property of the Los Angeles Can Company was acquired from John Pike Company, who acted as brokers, by the Los Angeles Can Corporation, organized by Continental to operate this plant. The Los Angeles Can Corporation continued as a subsidiary of Continental until October 1, 1930, on which date its personal property was transferred to Continental Can Company, Inc. of California. Because the property of Los Angeles Can Company was

[fol. 1304] acquired from a broker, the balance sheet and income statements are not available.

This property was acquired in order that Continental might enter competition on the Pacific Coast with the American Can Company which was already established there.

No. 2

Seattle Can Company

On January 5, 1927 Continental purchased the capital stock of Seattle Can Company for 3,411 shares of common stock of Continental and $1,586. in cash. The company was a manufacturer of metal containers, located at Seattle, Washington. A balance sheet as of November 30, 1926 is annexed hereto as Exhibit 2. Income statements of the acquired company as of December 31, 1926 and as of December 31, 1925 are annexed hereto as Exhibit 2A. The income statement for December 31, 1924 is not available. The property was operated as Continental Can Company of Washington until this subsidiary was merged with Continental on August 31, 1932. The company was acquired for the same reason as the Los Angeles Can Company.

No. 3

G. N. Easton Can Company

On January 12, 1927 Continental acquired 1,395 shares of the capital stock of G. N. Easton Can Company for 4,185 shares of Continental common stock. The company, located in San Jose, California, was a manufacturer of metal containers. A balance sheet as of December 31, 1926 is annexed hereto as Exhibit 3. The only available income statement as of December 31, 1926 is annexed hereto as Exhibit 3A.

[fol. 1305] The property was operated as a subsidiary under the name of Continental Can Company, Inc. of California until May 31, 1932 upon which date it was merged with Continental. This company was also acquired because its location on the Pacific Coast enabled Continental to

enter an area theretofore dominated by the American Can Company.

No. 4

Passaic Metal Ware Company

On January 10, 1928 Continental acquired all of the outstanding common stock of Passaic Metal Ware Company, a New Jersey corporation, consisting of 17,889 shares of Passaic in exchange for 11,926 shares of Continental common stock, without par value. The company's only plant was located at Passaic, New Jersey. A balance sheet as of October 31, 1927 is annexed hereto as Exhibit 4. The only available income statement as of October 31, 1927 is also annexed hereto as Exhibit 4A.

The purpose of this acquisition was to engage in the manufacture and sale of general line cans which Continental did not then produce, consisting of smaller sized highly decorated cans for talcum powder, tooth powder, cereal, etc. At the time of acquisition, Continental did not duplicate any type of can made by the Passaic Company, with the exception of a can for varnish and insecticide, which constituted approximately 5% of the business of the Passaic Company.

No. 5

Seattle-Astoria Iron Works

On January 31, 1928, Continental acquired all of the outstanding stock of the Seattle-Astoria Iron Works, a Washington corporation, consisting of 5,000 shares, in ex-
[fol. 1306] change for 16,250 shares of Continental common stock, without par value. This company sold no cans, but manufactured machinery for making and closing cans and canning house machinery. Its only plant was located at Seattle, Washington. A balance sheet as of June 30, 1927 is annexed hereto as Exhibit 5. Income statements for the years ending June 30, 1925, 1926 and 1927 are also annexed hereto as Exhibit 5A.

The purpose of this acquisition was to enable Continental to supply machinery for making cans at its three Pacific coast factories, as well as certain machinery for its eastern plants and also to supply closing machines to its Pacific coast customers.

No. 6

United States Can Company

This company was acquired by Continental on February 6, 1928. The company was a manufacturer of metal containers and its plants were located at Cincinnati, Ohio, St. Louis, Missouri, Chicago, Illinois, Baltimore, Maryland, and Roanoke, Virginia. The plan of acquisition called for the sale of the entire assets of the U. S. Can Co. to Continental and the dissolution of the U. S. Can Co. The consideration was as follows:

1. The assumption of all of the debts of the U. S. Can Company, including a bond issue in the principal amount of $1,200,000, dated March 1, 1927, to the Chase National Bank of New York, as Trustee, secured by a first mortgage on the properties of the U. S. Can Company.

2. Payment of $2,000,000 in cash which was paid to the preferred stockholders of the U. S. Can Company on its dissolution.

[fol. 1307] 3. 50,000 shares of the common stock of Continental Can Company were delivered to the U. S. Can Company to be distributed in liquidation to its common stockholders.

A consolidated balance sheet as of November 30, 1927 of the U. S. Can Co. is annexed hereto as Exhibit 6. Income statements of the U. S. Can Co. as of December 31, 1924, 1925 and 1926 are annexed hereto as Exhibit 6A.

The purpose of Continental in this acquisition was to place it in a position to compete more strongly with American Can Co. and others in localities in which theretofore there had been no such competition, and also to broaden its field of sales in localities in which theretofore Continental was not represented and had not been able to compete. Continental was faced with the alternative either of building new factories in those localities or of acquiring existing factories. In taking over the plants of the U. S. Can Co., it adopted the latter alternative as the more economical measure.

At the time of this acquisition, Continental had no plants

in Cincinnati, Roanoke or St. Louis. U. S. Can Co. had no sales of general line cans in the Chicago district and Continental had no sales of general line cans in the Baltimore district. The only existing competition between Continental and U. S. Can Co. was in sales of packers open top cans in the Baltimore and Chicago districts. In the Chicago district packers cans sold by the U. S. Can Co. constituted 10½% of the number sold by Continental. In the Baltimore district packers cans sales of the U. S. Can Co. constituted 5½% of the sales by Continental. In the Baltimore district the U. S. Can Co. sold 3% of the total production of all packers cans and 5% in the Chicago district. The packers cans sold by U. S. Can Co. in the Chicago and Baltimore districts constituted less than 1¼% [fol. 1308] of the total annual production in this country.

No. 7

Southern Can Company

On May 2, 1928, the Southern Can Company sold its entire assets to Continental. The consideration was:

1. The assumption of all the debts of the Southern Can Company.
2. The redemption of its outstanding preferred stock of $1,250,000 at $107.50 and accrued dividends.
3. Delivery of 11,500 shares of Continental common stock which was distributed in liquidation to the Class A and Class B common stockholders of the Southern Can Company.

The Southern Can Company was located at Baltimore, Maryland and was engaged in the manufacture of metal containers and other metal ware products. A balance sheet as of May 2, 1928 is annexed hereto as Exhibit 7. Income statements as of December 31, 1925, 1926 and 1927 are annexed hereto as Exhibit 7A.

The packers can production of the Southern Can Company in the Baltimore district was approximately 8% of the total production, so that competition was not curtailed substantially by its acquisition.

The property was acquired to utilize its modern buildings and to enable Continental to manufacture its cans in

this factory rather than shipping them in from Syracuse and other factories at considerable expense.

No. 8

New Orleans Can Company

On June 26, 1928, Continental purchased the capital stock of the New Orleans Can Company for $187,500. The company was located at New Orleans, Louisiana, and was a manufacturer of metal containers. A balance sheet as of [fol. 1309] May 31, 1928 is annexed hereto as Exhibit 8. Income statements are not available, but it is known that the company had made profits in 1925 of $13,653.35, in 1926 of $9,139.41 and in 1927 of $28,929.29.

The Company was acquired to enable Continental to supply its customers located in the Gulf Coast area.

No. 9

The R. Hardesty Manufacturing Company

On October 31, 1928, Continental purchased from the R. Hardesty Manufacturing Company the portion of its assets devoted to can manufacturing and distributing. No liabilities of the company were assumed, and it continued as a going corporation in the operation of all of its business other than its can business. Fixed assets were purchased at a valuation of $125,000, payment being made in the common stock of Continental on the basis of its closing market value on the day of transfer. Inventory was purchased at net cost or market, whichever was lower, less a 2% discount for cash.

The R. Hardesty Manufacturing Company was a Colorado corporation, with its plant and place of business at Denver, Colorado. A balance sheet as of October 31, 1928 is annexed hereto as Exhibit 9. Income statements as of December 31, 1926, 1927 and as of October 31, 1928 are annexed hereto as Exhibit 9A.

The total sales of the R. Hardesty Manufacturing Company's can manufacturing department were approximately $300,000 per year. Its sales were confined to the district in the neighborhood of Denver, Colorado, and in that district Continental had no existing plant and was not in competi-

[fol. 1310] tion at the date of the acquisition. Its nearest plants were in Chicago and East St. Louis and no sales were made from them in the Denver district. On the other had, the nearest plant of the American Can Company at the date of acquisition was located at Kansas City and sales from that plant were being made in the Denver district by American prior to this entrance of Continental into competition there.

No. 10

Wheeling Can Company

Wheeling Can Company, a West Virginia corporation, was a wholly owned subsidiary of Wheeling Steel Corporation, having a plant and place of business at Wheeling, West Virginia, and a plant at Warwood, West Virginia. On December 3, 1928, Continental purchased all the assets of Wheeling Can Company, including its machinery and equipment, for 27,000 shares of Continental common stock. In addition, the inventory of tin plate, together with goods in process and finished products, was purchased at its cost of $685,363.02. A balance sheet as of October 31, 1928 is annexed hereto as Exhibit 10. Income statements as of December 31, 1926, December 31, 1927 and as of October 31, 1928 are annexed hereto as Exhibit 10A.

At the time of acquisition total annual sales of Wheeling Can Company were approximately 1/11th of those of Continental and 1/32nd of those of American Can Company. In Wheeling, West Virginia, Continental had no plant whatsoever and was not in competition with the Wheeling Company at the time of acquisition.

[fol. 1311] No. 11

Bedford Can Company, Inc.

Bedford Can Company, Inc. was a Virginia corporation with a plant and place of business at Bedford, Virginia. On December 5, 1928, Continental acquired the land, buildings, machinery and equipment of Bedford for 4,576 shares of common stock of Continental. In addition, its inventory of tin plate and other supplies were taken over at an agreed valuation by payment in shares of common stock of Contin-

ental on the basis of $59. per share. A balance sheet as of November 30, 1928 is annexed hereto as Exhibit 11. Income statements as of December 31, 1926, December 31, 1927 and November 30, 1928 are annexed hereto as Exhibit 11A.

Total sales of Bedford were approximately $700,000 annually and these sales were largely confined to the Bedford district. Prior to its acquisition of the company, Continental had no plant in that district, its nearest plants being at Roanoke, Virginia and Baltimore, Maryland. Sales of packers cans by Bedford in the Baltimore district were less than 3% of total annual sales there.

No. 12

Manhattan Can Company

Manhattan Can Company was a New York corporation operating a small plant in the Bush Terminal Building, Brooklyn, New York. On December 31, 1928, Continental acquired all the assets of Manhattan, including its machinery and equipment, contracts and inventory of materials and supplies for $171,864.00, paid by 2,738 shares of Con- [fol. 1312] tinental common stock and $54.50 in cash. A balance sheet as of December 31, 1928 is annexed hereto as Exhibit 12. Income statements as of December 31, 1926, 1927 and 1928 are annexed hereto as Exhibit 12A.

The total annual sales of Manhattan were around $350,000. It was subjected to an annual rent charge of $24,000 and for this reason did not find it profitable to operate and accordingly decided to sell its equipment. Continental had no Brooklyn plant, and as the business of Manhattan was of a highly local nature, there was little, if any, competition theretofore existing between them, its annual sales having constituted less than 1% of the annual sales of Continental.

No. 13

McDonald Machine Company

On April 30, 1929, Continental exchanged 17,123 shares of its common stock for the total outstanding stock of McDonald. McDonald was not engaged in the manufacture

and sale of cans but only of can-making machinery. Its plant was located at Chicago, Illinois. A balance sheet as of March 31, 1929 is annexed hereto as Exhibit 13. Income statements as of December 31, 1926, 1927 and 1928 are annexed hereto as Exhibit 13A.

Prior to this acquisition, Continental's plants for manufacturing can-making machinery were located only in Syracuse, New York and Seattle, Washington. The acquisition was made in order to manufacture its machinery more economically in the North Central or Middle West district.

[fol. 1313] No. 14

Federal Can Company

On June 25, 1929, Continental purchased the business and assets of Federal for 4,652 shares of Continental common stock. The company was a manufacturer of metal containers, and its plant was located at Nashville, Tennessee. A balance sheet as of March 30, 1929 is annexed hereto as Exhibit 14. Income statements as of December 31, 1926, 1927 and 1928 are annexed hereto as Exhibit 14A.

The gross sales of Federal Can Company in 1928 were about $600,000 and of this amount over $425,000 were made in Tennessee. Prior to the acquisition of this company, Continental had no plant in Nashville, Tennessee.

No. 15

Eastern Shore Can Company

On July 2, 1929, Continental purchased all the assets of the Eastern Shore Can Company for $94,142.00 in cash, plus an amount equal to the accrued dividend of the outstanding preferred stock of Eastern and 8,750 shares of Continental common stock. All liabilities were assumed by Continental on the date of acquisition.

The Eastern Shore Can Company was a Maryland corporation engaged in the manufacture of metal containers, having its principal place of business at Hurlock, Maryland. A balance sheet as of July 2, 1929 is annexed hereto as Exhibit 15. Income statements as of December 31, 1926, 1927 and 1928 are annexed hereto as Exhibit 15A.

The property was acquired to facilitate the serving by Continental of its customers along the eastern shore of Maryland and of Virginia. In order to supply these custom-
[fol. 1314] ers prior to this acquisition it had been necessary for Continental to ship from Baltimore by way of Elkton, Maryland, and the acquisition resulted in the elimination of this circuitous route.

No. 16

Gille Manufacturing Company

On August 13, 1929, Continental purchased all the assets of the Gille Manufacturing Company for 15,980 shares of Continental common stock. All outstanding liabilities were assumed by Continental on the date of the acquisition. The Gille Manufacturing Company was engaged in the business of manufacturing metal containers and was located at Kansas City, Missouri. A balance sheet as of August 2, 1929 is annexed hereto as Exhibit 16. Income statements as of December 31, 1926, 1927 and 1928 are annexed hereto as Exhibit 16A.

Prior to this acquisition, American Can Company had a plant at Kansas City, Missouri, and this purchase was made to enable Continental to enter into immediate competition in that district.

No. 17

Sociedad Industrial de Cuba

On September 24, 1929, the capital stock of Sociedad Industrial de Cuba, consisting of 1,400 shares, was purchased by Continental for 6,907 shares of its common stock and $586 in cash. The company was engaged in the manufacture of metal containers and bottle caps and was located in Havana, Cuba. The property was operated under its own name as a subsidiary of Continental until July 1, 1945, on which date its name was changed to Continental Can Corporation which is a Western Hemisphere corporation. A balance sheet as of August 31, 1929 is annexed hereto as [fol. 1315] Exhibit 17. Income statements as of December 31, 1926, 1927 and 1928 are annexed hereto as Exhibit 17A.

The company was acquired by Continental in order to supply Cuban canners and enter the field in that country.

No. 18

Nashville Corrugated Box Company

On October 10, 1929, Continental purchased the business and assets of J. D. Goodpasture, trading as Nashville Corrugated Box Company, for 3,687 shares of Continental common stock and $42.08 in cash. The company was engaged in the manufacture of corrugated cartons and was located in Nashville, Tennessee. A balance sheet as at September 30, 1929 is annexed hereto as Exhibit 18. As assets only were purchased, income statements were apparently not required by Continental and hence, are not available. The business was incorporated shortly after its acquisition and is presently operated as a subsidiary of Continental.

The company was acquired in order that Continental might enter into the corrugated box field, a product which it had not theretofore manufactured.

No. 19

Penick & Ford, Ltd., Inc.

On December 10, 1929, Continental purchased the can business of Penick & Ford, a corporation engaged in the manufacture and distribution of molasses and allied corn products. The properties acquired by Continental were located at Harvey, Louisiana and Cedar Rapids, Iowa. The land, buildings and machinery at Harvey, Louisiana, and the [fol. 1316] machinery and equipment at Cedar Rapids, Iowa, were purchased for $339,798.90 in cash. The inventory was purchased for $148,100.32 in cash. Because only a part of the company's assets were purchased, a balance sheet or income statements are not available.

Penick & Ford sold its can business to Continental because it felt that Continental could effect large scale economies in its operations, and thus supply cans at a lower cost than Penick & Ford had been able to realize. In this way, Continental acquired an important customer.

No. 20

Gordon Can Company

On November 2, 1931, Continental purchased land, buildings, machinery and equipment and inventories of Gordon Can Company for $155,676.37 in cash. The company was located in Omaha, Nebraska, and was engaged in the manufacture of metal cans. A balance sheet as of June 30, 1931 is annexed hereto as Exhibit 19. As assets were purchased, full income statements covering the operation of the company are not available. However, sales and profit figures for 1928, 1929, 1930 and for the first six months of 1931 are annexed hereto as Exhibit 19A.

The company was acquired to facilitate serving Continental customers in Nebraska and to avoid the necessity of making shipments from more distant plants.

No. 21

Chase Bag Company

On December 14, 1932, Continental purchased for $78,528.74 land and buildings only, at Memphis, Tennessee, from Chase Bag Company and Riverside Land Company. As this acquisition was not of the business or equipment of the [fol. 1317] Chase Bag Company, neither income statements nor a balance sheet are available.

This building was merely purchased as a site for a Memphis plant subsequently put into operation by Continental.

No. 22

Manion Steel Barrel Company

On July 27, 1933, Continental Can Company of Pennsylvania, a wholly owned subsidiary of Continental, purchased from Rouseville Cooperage Company, trading in part as Manion Steel Barrel Company, machinery and equipment for $43,500 and inventories for $17,727.44 in cash. Manion Steel Barrel Company was engaged in the manufacture of metal containers and was located at Rouseville, Pennsylvania. As the purchase was one of assets of a portion of

the entire business, neither income statements nor a balance sheet are available.

The business was acquired in order that Continental might enter into the manufacture of steel barrels for oil products in the Pennsylvania area.

No. 23

Columbia Can Company

On February 28, 1935, Continental purchased the land, buildings, machinery and equipment and inventories of Columbia for $380,236.76. The company was engaged in the manufacture and sale of general line cans for eggs, sweeping compounds, ice creams, coffee, shoe polish, lard, ether and chemicals, and its plant was located at St. Louis, Missouri. A balance sheet as of February 28, 1935 is annexed hereto as Exhibit 20. Income statements as of De- [fol. 1318] cember 31, 1932, 1933 and 1934 are annexed hereto as Exhibit 20A.

Practically all of the business of Columbia Can Company was with customers located in the immediate vicinity of St. Louis, Missouri, and about 63% of their total sales for 1934 consisted of cans of a type not manufactured by the East St. Louis plant of Continental Can Company, Inc. These items included cans and drums for sweeping compounds, ice cream, ether and drugs, steel jacketed cans, coffee, shoe polish and 5 gallon square cans. About 24% of Columbia Can Company's sales for 1934 represented cans of a type not manufactured at any of the plants of Continental. The products of the Columbia Can Company were in competition with similar products of the Kansas City and St. Louis plants of American Can Company. Its controlling stockholders had recently died with the result that the heirs were desirous of disposing of this property. The sales volume of Columbia Can Company was considerably less than 1% of Continental sales volume in 1934.

No. 24

Janssen-Ostertag Manufacturing Company

On February 4, 1935, Continental purchased all of the assets of this company (except cash, life insurance, accounts and notes receivable) for cash in the amount of $40,682.09. The company was engaged in the manufacture and sale of general line cans, consisting of axle grease pails and miscellaneous grease cans, and was located at Kansas City, Missouri. A balance sheet as of December 31, 1934 is annexed hereto as Exhibit 21. Sales and earnings figures as of December 31, 1932, 1933 and 1934 are annexed hereto as Exhibit 21A.

[fol. 1319] The business of Janssen-Ostertag Manufacturing Company consisted almost exclusively of the manufacture and sale of axle grease pails and grease cans of a type not manufactured by either the Kansas City or East St. Louis plants of Continental. The products of this company were in competition with similar products of the Kansas City and St. Louis plants of American Can Company. The controlling stockholders of this company also had recently died with the result that the heirs were desirous of disposing of this property. The sales volume of this company was considerably less than 1% of Continental sales volume in 1934.

No. 25

Wilkes Barre Can Company

On August 9, 1936, Continental Can Company of Pennsylvania acquired the business and fixed assets of Wilkes Barre for $450,000, and its inventory, at cost or market, for approximately $204,000. The company was engaged in the manufacture of metal containers and household lines of a type not theretofore manufactured by Continental, and was located at Wilkes Barre, Pennsylvania. A balance sheet as of August 8, 1936 is annexed hereto as Exhibit 22 and sales and profit figures as of December 31, 1933, 1934 and 1935 are annexed hereto as Exhibit 22A.

The assets of this company were transferred to Continental in 1941.

The company was acquired to enable Continental to enter into a line of metalware specialties not theretofore manufactured by it.

[fol. 1320] No. 26

Canonsburg Coal Company

In 1933, Continental purchased the Hazel Mine of the Chartiers Creek Coal Company of Canonsburg, Pennsylvania at a cost of $147,500 cash, together with mining rights covering about 500 acres of coal, and coal mining equipment formerly owned by this company. In January, 1934, Continental organized the Canonsburg Coal Company as a subsidiary of Standard Tin Plate Company to operate this property and it was disposed of in 1941. As this was a purchase of property, a balance sheet and income statements are not available.

The coal mine was adjacent to property then owned by Continental and was acquired as a source of supply to it.

No. 27

Metal Box and Printing Industries, Ltd.

On April 16, 1930, Continental acquired 50,000 shares out of 754,695 shares outstanding in Metal Box and Printing Industries, Ltd., which in 1931 acquired control of the British Can Company. The name of Metal Box and Printing Industries, Ltd. was subsequently changed to Metal Box Company, Ltd. As of April 1, 1946, Continental held approximately 9.75% of the stock of Metal Box Company and at no time since April 16, 1930 has Continental held a controlling interest in this company.

The Metal Box Company is engaged in the manufacture of metal containers in the United Kingdom. A consolidated balance sheet as of March 31, 1929, with additional capital transactions carried through to March 31, 1930 and giving effect to the acquisition by Continental of 50,000 ordinary shares on April 16, 1930, is annexed hereto as Exhibit 23. [fol. 1321] Income statements are not available but it appears from Moody's Manual of Investments, Industrial's Volume 1932, page 3265, that consolidated net profits for

the years ending March 31 (after depreciation but before income tax or debiting or crediting interest) were: 1928 £212,413; 1929 £236,896; 1930 £235,217.

The acquisition of stock on April 16, 1930 was made to extend financial aid to the British company at a period of serious depression in England, and Continental has subsequently maintained a roughly proportionate interest in this company as an investment. It also has made a license agreement with Metal Box under which that company manufactures and uses machinery of Continental design in the British Isles and elsewhere in the Empire.

Other acquisitions by Continental of container manufacturing enterprises during the period 1926 through 1936, covered by questions relating to the above 27 acquisitions, were Manufacturers Can Company, Inc. and Southwestern Can Company, which we have numbered 28 and 29.

No. 28

Manufacturers Can Company, Inc.

On January 3, 1922, Manufacturers Can Company sold to Continental its machinery, office supplies and contracts for $200,000 in cash and its inventory of materials and supplies as of December 31, 1928 at cost, less 2% discount on all materials except tin plate in original packages. The land and buildings owned by the company were not included in the sale nor were its liabilities assumed as part of the transfer. The company operated a plant at Harrison, New Jersey, where it made specialties such as cans for oil, grease, paints, varnish, etc. As the purchase was one of assets, a balance sheet and income statements are not available. [fol. 1322] The business of the company was of a local nature and as its operations had not been successful during the four or five years preceding its acquisition by Continental, it had decided to sell its equipment and go out of business. The total sales of the company were less than 1½% of those of Continental.

No. 29

Southwestern Can Company

On June 19, 1935, Continental acquired from the liquidating trustees of Southwestern Can Company its land, building and equipment for $111,202.30 in cash. The company had previously been engaged in the manufacture of metal containers at Houston, Texas. As the purchase was one of assets, a balance sheet and income statements are not available.

These assets of Southwestern were acquired by Continental after a decision on the part of its management to liquidate and go out of business.

We again take up the companies next enumerated in the Commission's letter, and we have numbered them consecutively for convenience, beginning with 30.

No. 30

Continental Can Company, Inc. of Washington

This wholly owned subsidiary was formerly known as the Seattle Can Company as to which see discussion under No. 2, *supra*. Continental Can Company, Inc. of Washington did not acquire stock control of any other company. This subsidiary company was merged with Continental on August 31, 1932.

[fol. 1323]

No. 31

Continental Can Company, Inc. of California

This wholly owned subsidiary was known, prior to June 20, 1927, as the G. N. Easton Can Company as to which see discussion under No. 3, *supra*. On November 8, 1930, Continental of California acquired stock control of Gardner Manufacturing Company, Limited, of Sunnyvale, California. A balance sheet as of October 18, 1930 is annexed hereto as Exhibit 24. Income statements of the company are not available.

No. 32

Whittall Can Company, Limited

Between September 19, 1935 and December 31, 1935, Continental acquired 127,874 shares of common stock of Whittall Can Company, Limited, out of a total of 130,000 shares outstanding or 98.4% of its voting stock at a cost of $1,078,043. Between December 31, 1935 and March 31, 1936, additional shares of common stock were issued by Whittall, and Continental increased its interest in this company by acquiring 30,853 shares of common stock at a cost of $261,676. A balance sheet as of February 29, 1936 is annexed hereto as Exhibit 25. Income statements for the years ending February 28, 1934 and 1935 and February 29, 1936 are annexed hereto as Exhibit 25A.

On October 19, 1935, Continental organized Continental Can Company of Canada, Ltd. and on June 30, 1936, this company purchased all assets and assumed all liabilities, except indebtedness to Continental, of Whittall for a consideration of $1,858,635.16. A balance sheet as of June 30, 1936 is annexed hereto as Exhibit 25B.

[fol. 1324] The Whittall Company was incorporated in Canada and was engaged in the manufacture of metal packages, sanitary food containers, and paint cans. Its plant was located at Montreal, Quebec, Canada. The company was acquired to facilitate the supply of items of this type by Continental to customers in Canada and enter the can manufacturing industry in that country.

No. 33

Colonial Canners, Limited

On February 3, 1940, Continental formed this subsidiary in Ontario to take over canning plants and equipment formerly owned by the Empire Foods Corporation, Limited. These properties were located at Brighton, Ontario, Ste. Martine, Quebec, Hamilton, Ontario (2 plants), Cottom, Ontario, McGregor, Ontario, Harrow, Ontario, Essex, Ontario, Trenton, Ontario, Belleville and Desoronto, Ontario. The depreciated valuation of the properties on the books of the vendor at the date of acquisition is unknown. The con-

sideration for the acquisition was Continental's bid of $701,000 face value in bonds at the foreclosure sale arising from a secured loan of one million dollars by Continental to this company. As the enterprises were in default under the mortgage, they cannot be considered to be operating enterprises, and income statements are, therefore, not available.

The properties were thus acquired as a result of the foreclosure sale, and as they consisted of canning plants. Continental has been in the process of selling or leasing these plants.

[fol. 1325] No. 34

Gardner-Richardson Company

On August 27, 1942, Continental purchased certain patents and machinery for the manufacture of paper cans from the Gardner-Richardson Company for $162,500. The depreciated valuation of the acquired assets on the books of the vendor at this time is unknown. The company was located at Middletown, Ohio. The machinery was acquired to improve Continental's ability to produce spiral wound paper cans.

No. 35

Boothby Fibre Can Company

On November 6, 1942, Continental purchased the machinery and equipment of Boothby for $122,500 and its inventory at a cost of approximately $48,000. In addition, it leased the building in which Boothby was operating for a period of five years, at an annual rental of $7,000. As this purchase was one of assets, no balance sheet nor income statements are available nor is the depreciated valuation of the leased assets on the books of the lessor at the time of the lease known, there being no subsequent agreement to purchase them. The company was located at Roxbury, Massachusetts.

The assets were acquired to enable Continental to manufacture a type of all-paper container not theretofore manufactured by it.

No. 36

Square Star Can Company

On August 1, 1942, Continental purchased the name and certain of the assets of the Square Star Can Company, of St. Louis, Missouri, for $65,000 in cash. For a brief period [fol. 1326] thereafter, Continental also leased the building in which Square Star previously operated on a month to month basis at an annual rental of $1,320. This property has since been vacated. As the purchase was one of assets, income statements and a balance sheet are not available nor is the depreciated valuation of the leased assets on the books of the lessor known, there being no agreement to purchase the leased assets.

The Square Star Can Company manufactured paper cans with metal ends. Continental purchased some of its machinery for making such cans in order to be able to manufacture them in an area in which theretofore it had not competed. Another purpose of this acquisition was to secure capable management for this type of operation.

No. 37

Fonda Container Company

On December 21, 1942, Continental purchased machinery and equipment of Fonda for $37,500 and its inventory at cost. In addition, it leased the building in which Fonda was then operating on a year to year basis at an annual rental of $3,300 per year. As this acquisition was one of assets, no balance sheet nor income statements are available nor is the depreciated valuation of the leased assets on the books of the lessor known, there being no agreement to purchase them. The company was located at Utica, New York, and was engaged in the manufacture of paper packages.

It was acquired for the purpose of expanding the operations of Continental in the paper container field.

[fol. 1327] No. 38

Val Vita Food Products

On February 23, 1943, Continental purchased the can-making machinery and equipment of this company for $500,000 and its inventories at cost. In addition, the plant in which such machinery and equipment was previously housed was leased on a three-year basis at an annual rental of $30,000, subject to adjustments. As this acquisition was one of assets, no balance sheet nor income statements are available nor is the depreciated valuation of the leased assets on the books of the lessor known, there being no agreement to purchase same. The business was located at Fullerton, California.

Continental did not acquire the canning business of this company but only the can-making machinery, as it was thought that Continental could effect large scale economies as a supplier for the canning business of the Val Vita Company and thus reduce that company's cost of cans.

No. 39

The Container Company

On December 20, 1942, Continental acquired all the outstanding class "A" and "B" common stock of The Container Company for $1,650,000, and its preferred stock for $112,700. A balance sheet as of November 28, 1942 is annexed hereto as Exhibit 26. Income statements for 1940, 1941 and 1942 are annexed as Exhibit 26A. The company was located at Van Wert, Ohio, and was engaged in the manufacture of fibre drums, a product which Continental did not previously manufacture. The company is presently being operated as a subsidiary of Continental and in this way Continental has been able to enter the field of manufacturing fibre drums.

[fol. 1328] No. 40

Marco Chemicals, Inc.

On July 14, 1943, Continental acquired 200 shares of Marco common stock out of a total of 1,000 shares outstanding, and $50,000 in 4% debentures out of a total of $170,000 outstanding. The company is engaged in the production of resin, plastic products and chemicals, and is located in Sewaren, New Jersey. This company was organized immediately prior to Continental's acquisition of 20% of its shares, and consequently there were no balance sheet nor income statements prior to the date of acquisition.

Continental acquired a 20% stock interest in this company in order that it might receive information regarding developments in the field of plastic products, and as a first step in entering the plastic field.

No. 41

Bond Manufacturing Corporation, Inc.

On January 5, 1944, Continental acquired 88% of the capital stock of Bond and shortly thereafter acquired the remaining shares outstanding for a cash consideration of $4,500,000 for all outstanding shares. The company was located at Wilmington, Delaware, and also had a plant at Los Angeles, California. It was engaged in the manufacture of crown bottle caps and cork products. A balance sheet as of December 31, 1943 is annexed hereto as Exhibit 27. Income statements for the years ending 1941, 1942 and 1943 are annexed hereto as Exhibit 27A. In March, 1944, the name of this company was changed to Bond Crown and Cork Company.

At the time of acquisition, Bond had four wholly owned subsidiaries, to wit: Bond Equipment Company; Cork-Tex [fol. 1329] Products Co.; Brandywine Warehouse Company; and Bond Crown Company of California. Bond Crown and Cork Company is presently operated as a subsidiary of Continental. The company was acquired to secure capable and efficient management and to expand crown operations of Continental, and in order that Continental might enter into the related cork business.

Other Subsidiaries Acquired by Stock Control during 1942, 1943 and 1944

No. 42

Keystone Drum Company

On May 26, 1944, Continental acquired the entire outstanding stock of the Keystone Drum Company for a cash consideration of $225,000. The company was engaged in the manufacture of fibre drums and had plants at Charleroi, Pennsylvania; Elizabeth, New Jersey; Independence, Kansas and Pensacola, Florida. A balance sheet as at February 29, 1944 is annexed hereto as Exhibit 28. Income statements are not available. The company was operated as a subsidiary and is now in the process of dissolution.

The company was acquired because there were definite advantages in adopting the form of drum it manufactured for the packaging of resin solids, poured hot and allowed to cool. Asphalt, tar, pitch and waxes also fell into this category. The purchase was made to round out the line of fibre drum developments of The Container Company. (No. 39 above)

No. 43

Cameron Can Machinery Corporation

On July 7, 1944, Continental acquired all the capital stock of this company for $4,000,000 in cash. The company was [fol. 1330] engaged in the manufacture of can-making machinery and other machine parts and had its plant at Chicago, Illinois. A balance sheet as of December 31, 1943 is annexed hereto as Exhibit 29. Income statements as of December 31, 1941, 1942 and 1943 are annexed hereto as Exhibit 29A.

The company was acquired to secure exceptionally capable engineering talent for the design of can-making machinery and to enable Continental to manufacture and secure the advantages of the most efficient type of can-making and other machinery.

No. 44

Mono, Ltd. of Canada

In April, 1945, Continental sold to Colonial Canners, Ltd., its subsidiary discussed as No. 33 above, 507 shares of the stock of Mono, Ltd. of Canada, which Continental acquired as part of the assets received from Mono Service Company, discussed as No. 46 hereafter. These 507 shares were set up on Continental's books at the time of acquisition at the figure of $50,700, which was the same figure at which they were carried on Mono Service's books, and they were sold to Colonial Canners, Ltd. for $56,277 Canadian currency, which was the equivalent in American dollars of the $50,700 figure. In April and May, 1945, Colonial Canners, Ltd. offered to purchase the balance of the outstanding stock of Mono, Ltd. of Canada, 987 shares, for a total price of $197,400 Canadian currency. All of such stock except 2 shares has been acquired.

Mono Ltd. of Canada was engaged in the manufacture of paper containers and paper cups and its plant was located at New Toronto, Ontario, Canada. A balance sheet as of April 30, 1945 is annexed hereto as Exhibit 30. Income statements for the years ending September 30, 1942, 1943 and 1944 are annexed hereto as Exhibit 30A. The company was acquired to enable Continental's Canadian subsidiary to enter into the manufacture of a type of paper containers and paper cups not theretofore manufactured by it in Canada.

[fol. 1331] Other Acquisitions of Container Manufacturing or Distributing Enterprises

No. 45.

General Steel Wares, Ltd., McDonald Division

On April 15, 1944, Continental Can Company of Canada, Ltd., a wholly owned subsidiary of Continental, acquired the land, buildings, machinery and equipment, supplies and other inventory items, of the Toronto plant and the machinery and equipment of the Montreal plant of this division of General Steel Wares, Ltd. for $1,450,000 in cash. Be-

cause this acquisition was only of a portion of the entire business of General Steel Wares, Ltd., a balance sheet and income statements are not available.

Continental purchased the assets of this business in order that its Canadian subsidiary would be in a position to furnish practically every type of general line cans, including kit pails. Had the business been bought by American Can, as otherwise might have occurred, it would have placed that company so far ahead in the general line business that Continental could not have effectively thereafter competed with it in that field in Canada. In acquiring this business, Continental secured the trade of many important customers who prior thereto had purchased a portion of their requirements from the American Can.

No. 46

Mono-Service Company

On September 21, 1944, Continental purchased 7,230 shares of common stock out of the total outstanding issue of 10,000 shares of Mono-Service Company, a New Jersey corporation, at the price of $300 per share, or $2,169,000 in cash. Between September 22nd and 29th, inclusive, Con- [fol. 1332] tinental purchased an additional 104 shares of the stock at this price for a total of $31,200. Mono-Service Company was dissolved on September 30, 1944. In liquidation, Continental purchased their interest in the balance of tangible personalty from the remaining stockholders for $799,800 on October 1, 1944. The company was engaged in the manufacture of hot drink cups and paper containers and its plant was located at Newark, New Jersey. A balance sheet as of September 30, 1944 is annexed hereto as Exhibit 31. Income statements for the years ending September 30, 1942, 1943 and 1944 are annexed hereto as Exhibit 31A.

At the time of this acquisition, Continental was not manufacturing hot drink cups nor was it manufacturing the type of paper containers made by Mono-Service Company. The acquisition was made to secure excellent engineering talent, an important trade-name and an economical operating plant, as well as to enter the paper cup field.

No. 47

Owens-Illinois Can Company

On October 31, 1944, Continental acquired all of the business, property and assets of the Owens-Illinois Can Company, a subsidiary of the Owens-Illinois Glass Company for $7,500,000. Continental also agreed to assume all liabilities except a note of $7,750,000 from Owens-Illinois Can to Owens-Illinois Glass. Owens-Illinois Can Company had at the time of acquisition plants at Chicago, Illinois; McKees Rocks, Pennsylvania and Baltimore, Maryland. It also owned property at St. Louis, Missouri, though no enterprise was in operation there. A balance sheet as of September 30, 1944 is annexed hereto as Exhibit 32. Income statements as of December 31, 1942 and 1943 and as of September 30, 1944 are annexed hereto as Exhibit 32A. [fol. 1333] At the time of the acquisition, Owens-Illinois had decided to dispose of its can-manufacturing business and thereafter confine its operations to the glass business. Of the general line sales of Owen-Illinois Can Company, approximately 50% was of a different type than that manufactured by Continental, such as steel pails, tobacco containers and containers for cosmetics, in which fields Continental did not have substantial participation. The balance of its general line volume covered an infinite variety of containers made by a large number of manufacturers in a highly specialized and competitive field. Packers' can production of Owens-Illinois Can Company was a minor portion of their business and a small part of total business of this type, its annual sales constituting only $2,600,000 as against an estimated total production of $200,000,000.

This proposed acquisition was consummated after it had been fully presented to the Department of Justice.

It is believed that the foregoing should constitute the information requested by the Commission.

Respectfully submitted, Continental Can Company, Ins. By Sherlock McKewen, Secretary and Treasurer.

[fol. 1334] GOVERNMENT'S EXHIBIT 788

Certified copy of a Portion of Minutes of a Meeting of the Board of Directors of Continental Can Company, Inc., Held May 16, 1956, at 100 East 42nd Street, New York, N. Y.

"The Chairman indicated to the Board that he had been in negotiation with two of the leading glass companies, and that if his negotiations could be successfully completed, Continental would acquire one or both of these companies.

After a general discussion, it was moved and seconded, that the Board approve the action of the Chairman in entering into these negotiations and the possible acquisition of the glass container companies."

I, L. R. Dodson, Secretary of Continental Can Company, Inc., have compared the foregoing excerpt with the original thereof, as recorded in the minute book of said Company, and do certify that the same is a correct and true transcript therefrom. I do further certify that there was at all times a quorum present at the meeting and that the foregoing resolutions have not been revoked or amended.

Dated:—

L. R. Dodson, Secretary

The charts that follow, in several instances, include the term "All Others." The use of this term, in each instance, finds its basis in the title section of each chart.

The phrase "Total Industry" or the word "Industry" is used in several charts. The use of the word or phrase has, in each instance, its basis in the title section of each chart.

The source information serving as the basis for each chart comes primarily from data published in the regular course of business by statistical gathering institutes or associations of industry, by private publications, by agencies of Government, by defendant Companies and other firms as producers or users of containers.

See following page for regional statistics and method of computation.

[fol. 1373] Notes Applicable to Metal Can Charts for 1955 2905

West of the Rockies

All Types

On a tonnage basis the West of the Rockies market area statistics were computed by subtracting the Hawaiian Islands metal can shipments for each end use category (shipments of American Can Co. plants in Hawaii) from the metal can statistics covering the west geographic area (States of Washington, Oregon and California) for 1955 as published in the Bureau of the Census, Facts for Industry, Metal Container Summary, Series M75D. Statistical data furnished the Department in base boxes of tin plate was converted to a tonnage basis by using conversion factors as published in the Facts for Industry, Metal Cans Summary, Series M75D.

Since the west geographic area in the Bureau of the Census, Facts for Industry tabulations includes the States of Washington, Oregon and California, the shipments from Utah can plants were included in the West of the Rockies market area. In the other States located west of the eastern boundaries of Idaho, Utah and Arizona there were no can manufacturing plants in 1955.

As mentioned above the computations dividing the East and West areas was accomplished on a tonnage basis. The tonnage was then converted to thousands of units by multiplying the number of cans which might have been produced for each end use category from one short ton of steel consumed (See Annual Report of Steel and Tin Consumed in Metal Cans published by the Can Manufacturers Institute, Inc. for 1947-1956, pages 9 and 10) and applied to the West tonnage.

The conversion factors used for 1955 in converting one ton of steel to can units were as follows:

(a) food containers 9237 units
(b) beer containers 10161 units
(c) soft drink containers 11167 units
(d) non-food* containers 7681 units

The sum of food, beer, soft drink and non-food containers, on a unit basis, equal the U. S. total of all types of containers West of the Rockies.

---

* Non-food containers include:

(a) pet food
(b) oil, open top (1 qt. and 5 qt.)
(c) all other non-food

[fol. 1374]

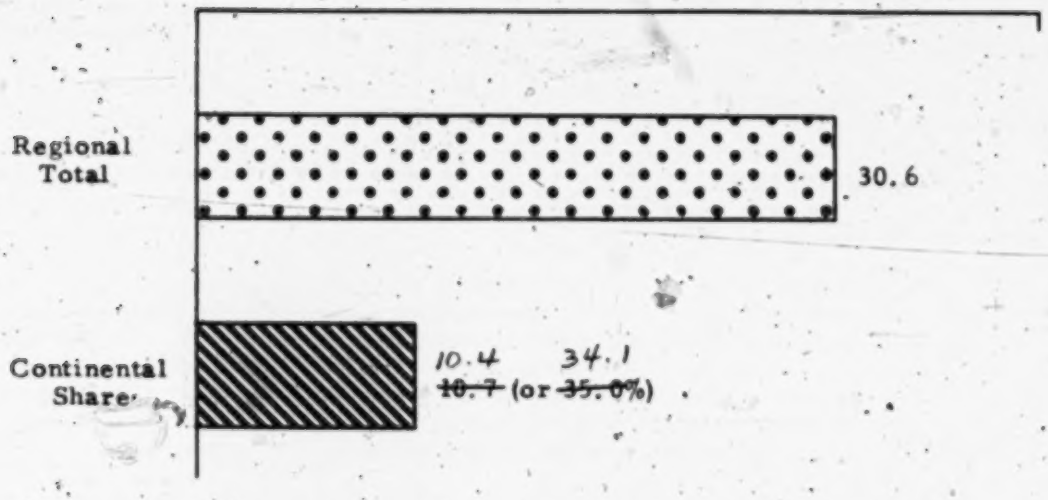
EAST OF ROCKIES

(Billions of Units)*



* Rounded to nearest Hundred Million.

Source: U.S. Total from the Bureau of the Census, Facts for Industry, Metal Container Summary, 1956 Series M75D exclusive of the Hawaiian Island shipments.

See following page for regional statistics and method of computation.

[fol. 1375] Notes Applicable to Metal Can Charts for 1955 29097

East of the Rockies

All Types

Metal can shipments, by end use categories, for West of the Rockies market area, was subtracted from the Continental U. S. total (exclusive of the Hawaiian Islands), to get the volume applicable to East of the Rockies market area, on a tonnage basis. The tonnage was then converted to thousands of units by multiplying the number of cans which might have been produced for each end use category from one short ton consumed (See Annual Report of Steel and Tin Consumed in Metal Cans published by the Can Manufacturers Institute, Inc. for 1947-1956, pages 9 and 10) and applied to the East tonnage.

The conversion factors used for 1955 in converting one ton of steel to can units were as follows:

(a) food containers 9237 units
(b) beer containers 10161 units
(c) soft drink containers 11167 units
(d) non-food* containers 7681 units

The sum of food, beer, soft drink and non-food containers, on a unit basis, equal the U. S. total of all types of containers East of the Rockies.

* Non-food containers include:

(a) pet food
(b) oil, open top (1 qt. and 5 qt.)
(c) all other non-food

West of the Rockies

Food

On a tonnage basis the West of the Rockies market area statistics were computed by subtracting the Hawaiian Islands metal can shipments for each end use category (shipments of American Can Co. plants in Hawaii) from the metal can statistics covering the west geographic area (States of Washington, Oregon and California) for 1955 as published in the Bureau of the Census, *Facts for Industry, Metal Container Summary, Series M75D.* Statistical data furnished the Department in base boxes of tin plate was converted to a tonnage basis by using conversion factors as published in the *Facts for Industry, Metal Container Summary, Series M34D.*

Since the west geographic area in the Bureau of the Census, *Facts for Industry* tabulations includes the States of Washington, Oregon and California, the shipments from Utah can plants were included in the West of the Rockies market area. In the other States located west of the eastern boundaries of Idaho, Utah and Arizona there were no can manufacturing plants in 1955.

The tonnage for the food group was then converted to thousands of units by multiplying the number of cans which might have been produced from one short ton of steel consumed (See Annual Reports of Steel and Tin Consumed in Metal Cans published by the Can Manufacturers Institute, Inc. for 1947-1954, pages 9 and 10).

The conversion factor used for 1955 to convert the food group tonnage to units was 9237 units per short ton.

Food containers include the following commodity categories:

(a) fruit and vegetable
(b) evaporated milk
(c) other dairy products
(d) fish and seafood
(e) meat
(f) lard and shortening
(g) all other food (including soup and baby food)
(h) coffee

[fol. 1383] Notes Applicable to Metal Can Charts for 1955

2915

East of the Rockies

Non-Food

The East of the Rockies shipments was accomplished by subtracting West of the Rockies tonnage from the U. S. total (exclusive of Hawaiian Islands). The tonnage was then converted to thousands of units by multiplying the number of cans which might have been produced from one short ton of steel consumed (See Annual Reports of Steel and Tin Consumed in Metal Cans published by the Can Manufacturers Institute, Inc. for 1947-1956, pages 9 and 10). The conversion factor used for 1955 to convert the non-food group tonnage to units was 7,681 units per short ton. Non-food containers include the following commodity categories: pet food; oil, open top (1 qt. and 5 qt.); all other non-food.

On a tonnage basis the West of the Rockies market area statistics were computed by subtracting the Hawaiian Islands metal can shipments for each end use category (shipments of American Can Co. plants in Hawaii) from the metal can statistics covering the west geographic area (States of Washington, Oregon and California) for 1955 as published in the Bureau of the Census, Facts for Industry, Metal Container Summary, Series M75D. Statistical data furnished the Department in base boxes of tin plate was converted to a tonnage basis by using conversion factors as published in the Facts for Industry, Metal Container Summary, Series M75D.

Since the west geographic area in the Bureau of the Census, Facts for Industry tabulations includes the States of Washington, Oregon and California, the shipments from Utah can plants were included in the West of the Rockies market area. In the other States located west of the eastern boundaries of Idaho, Utah and Arizona there were no can manufacturing plants in 1955.

The tonnage was then converted to units by the same method as mentioned above.

Notes Applicable to Glass Containers for 1955

East of the Rockies

All Types

Data for East of the Rockies was accomplished by subtracting the total for West of the Rockies from the Continental United States total.

Containers included in the non-food group are both narrow neck and wide mouth glass containers used for household and industrial, toiletries and cosmetics, and medicinal and health supplies.

Data for the Continental Can Company, Hazel-Atlas Division are from the answers to Plaintiff's Interrogatory No. 13. The information furnished reflects sales to customers rather than actual shipments. Plants and warehouses alike are treated as shipping points to which sales are attributed, and inter-plant shipments are eliminated. The data also contains a small amount of export sales plus other minor variations resulting from lost or misplaced data cards and the use of different methods of handling the cards. For a more detailed description of these variations see pages 1 through 4 of the answer to Plaintiff's Interrogatory No. 13. For these reasons the figures set forth in the answer to Plaintiff's Interrogatory No. 13 do not exactly coincide with the statistical shipment data the Hazel-Atlas Glass Company furnished the Glass Containers Manufacturers Institute, Inc. which the Government used in Folder "A" Statistical Tables. In most instances these differences are minor.

2920

Notes Applicable to Glass Containers for 1955

West of the Rockies

All Types

The computation of West of the Rockies statistics included domestic shipments of glass containers by food, non-food, beer, beverage categories and were consolidated for those companies operating and shipping glass from plants West of the Rockies. This tabulation included the following companies operating plants in the States of Washington, Oregon and California.

Anchor Hocking Glass Co. (its subsidiary Maywood Glass Co.)
Ball Bros. Co.
Glass Containers Corp. (its subsidiary United Can and Glass Co.)
Continental Can Co., Hazel-Atlas Division
Alexander Kerr & Co., Inc.
Latchford Glass Co.
Northwestern Glass Co.
Owens-Illinois Glass Co.
Thatcher Glass Manufacturing Co.

Containers included in the non-food group are both narrow neck and wide mouth glass containers used for household and industrial, toilstries and cosmetics, and medicinal and health supplies.

Data for the Continental Can Co., Hazel-Atlas Division are from the answers to Plaintiff's Interrogatory No. 13. The information furnished reflects sales to customers rather than actual shipments. Plants and warehouses alike are treated as shipping points to which sales are attributed, and inter-plant shipments are eliminated. The data also contains a small amount of export sales plus other minor variations resulting from lost or misplaced data cards and the use of different methods of handling the cards. For a more detailed description of these variations see pages 1 through 4 of the answer to Plaintiff's Interrogatory No. 13. For these reasons the figures set forth in the answer to Plaintiff's Interrogatory No. 13 do not exactly coincide with the statistical shipment data the Hazel-Atlas Company furnished the Glass Containers Manufacturers Institute, Inc. which the Government used in Folder "A" Statistical Tables. In most instances these differences are minor.

Continental United States Shipments of *All Types* of Metal Containers for 1955, 1956 and 1957 Compared with the Leading Manufacturers in the Industry
(In Thousands of Units)

	All Types of Metal Containers					
	1957		1956		1955	
	Volume	Percent	Volume	Percent	Volume	Percent
All Types Metal Containers, Total	*41,529,266	100.0	42,812,540	100.0	39,796,497	100.0
American Can Co.	15,456,013	37.2	16,358,942	38.2	15,821,371	39.8
Continental Can Co.	13,596,456	32.8	13,840,068	32.3	12,972,860	32.6
National Can Co.	2,287,467	5.5	2,209,785	5.2	1,967,401	4.9
All Other Manufacturers	10,189,330	24.5	10,403,745	24.3	9,034,865	22.7

Note: U. S. and company unit totals are the sum of all types of containers that were converted from base boxes of tin plate to short tons of steel, by using Bureau of the Census conversion factors for metal cans, as published in the Facts For Industry, Metal Containers Summary, Series M34D, then converted to 000 units, by multiplying number of cans which might have been produced from one short ton of steel consumed, (see Can Mfgrs. Institute, Inc., for 1947-1956 and 1948-1957 (pages 9 and 10, 11 and 12).

Source: U. S. total from Bureau of the Census, Facts For Industry, Metal Container Summary, Series M34D, less Hawaiian Island shipments, the total tonnage deducted amounting to 93,088 short tons for 1955, 78,572 short tons for 1956, 49,934 short tons for 1957.

Data for Continental Can Co. is from DP 2134 through DP 2176. Metal can statistics for American Can Company and National Can Company are from those companies.

[fol. 1432] 2c

Continental United States Shipments of Metal *Food Containers*, for 1955, 1956 and 1957 Compared with the Leading Manufacturers in the Industry

(In Thousands of Units)

	Metal Food Containers					
	1957		1956		1955	
	Volume	Percent	Volume	Percent	Volume	Percent
Metal Food Containers, Total	25,379,074	100.0	26,883,120	100.0	24,734,349	100.0
American Can Co.	8,861,397	34.9	9,803,577	36.5	9,509,528	38.4
Continental Can Co.	7,515,128	29.6	7,902,712	29.4	7,444,024	30.1
National Can Co.	1,290,854	5.1	1,250,178	4.6	982,318	4.0
All Other Manufacturers	7,711,695	30.4	7,925,653	29.5	6,798,479	27.5

Food containers include the following commodity categories: fruit and vegetable, evaporated milk, other dairy products, fish and seafood meat, lard and shortening, all other food, coffee.

Note: U. S. and company shipments were converted from base boxes of tin plate to short tons of steel, by applying Bureau of the Census conversion factors for metal cans, as published in the Facts For Industry, Metal Containers Summary, Series M34D. Short ton shipments were then converted to thousands of units, by multiplying actual number of Food Cans which might have been produced from each short ton of steel consumed, (see Annual Report of Steel and Tin Consumed in Metal Cans published by Can Manufacturers Institute, Inc. for 1947—1956 pages 9 and 10 and 1948—1957, pages 11 and 12). Unit shipments were estimated on the basis of 9,237 food cans per ton for 1955; 9,254 food cans per ton for 1956 and 9,248 food cans per ton for 1957.

Source: U. S. Total from Bureau of the Census, Facts For Industry, Metal Container Summary, Series M34D, exclusive of Hawaiian Island shipments. The total tonnage deducted amounted to 93,044 short tons for 1955; 78,524 short tons for 1956; 49,835 short tons for 1957.

Plaintiff's Statistical Tables—Folder B

SECTION 1 - FOLDER B

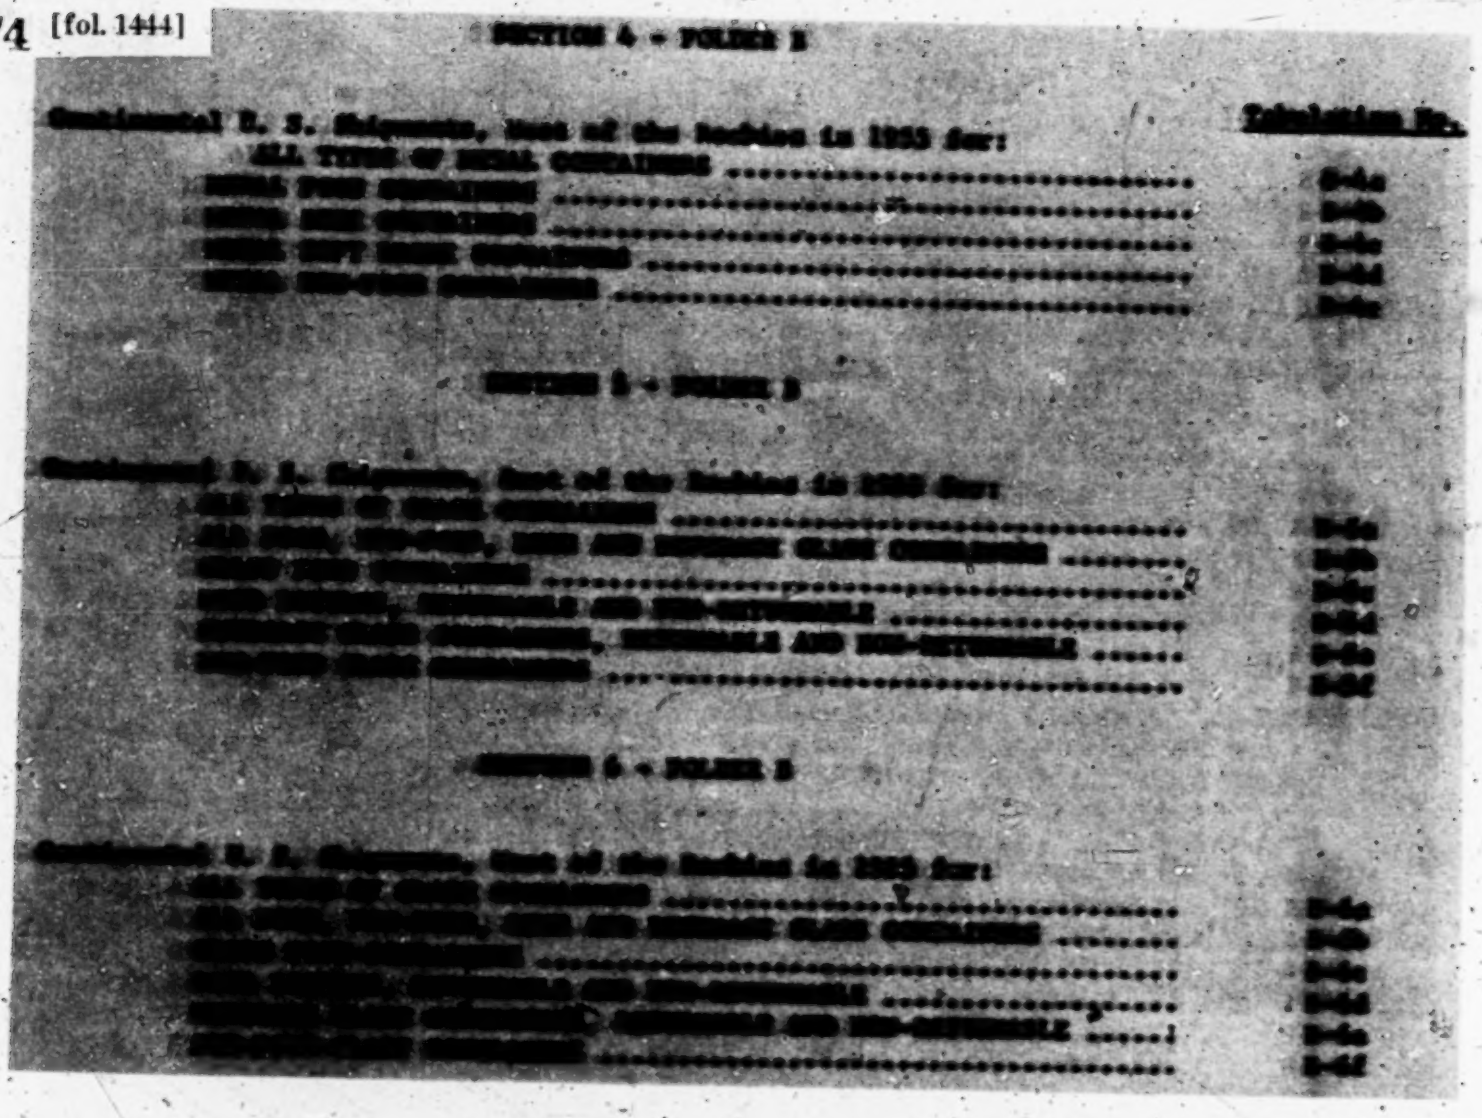
	Tabulation No.
Continental U. S. Shipments, East of the Rockies in 1955 for:	
GLASS AND METAL CONTAINERS, ALL TYPES	B-1a
GLASS AND METAL FOOD, NON-FOOD, BEER, SOFT DRINK AND BEVERAGE CONTAINERS	B-1b
GLASS AND METAL FOOD CONTAINERS	B-1c
GLASS AND METAL BEER CONTAINERS	B-1d
GLASS AND METAL SOFT DRINK AND BEVERAGE CONTAINERS	B-1e
GLASS AND METAL NON-FOOD CONTAINERS	B-1f

SECTION 2 - FOLDER B

Continental U. S. Shipments, West of the Rockies in 1955 for:	
GLASS AND METAL CONTAINERS, ALL TYPES	B-2a
GLASS AND METAL FOOD, NON-FOOD, BEER, SOFT DRINK AND BEVERAGE CONTAINERS	B-2b
GLASS AND METAL FOOD CONTAINERS	B-2c
GLASS AND METAL BEER CONTAINERS	B-2d
GLASS AND METAL SOFT DRINK AND BEVERAGE CONTAINERS	B-2e
GLASS AND METAL NON-FOOD CONTAINERS	B-2f

SECTION 3 - FOLDER B

Continental U. S. Shipments, East of the Rockies in 1955 for:	
ALL TYPES OF METAL CONTAINERS	B-3a
METAL FOOD CONTAINERS	B-3b
METAL BEER CONTAINERS	B-3c
METAL SOFT DRINK CONTAINERS	B-3d
METAL NON-FOOD CONTAINERS	B-3e



[redacted]

[fol. 1446] 2976 NOTES APPLICABLE TO THE METAL CAN TABULATIONS IN SECTIONS 3 AND 4 OF FOLDER 8.

On a tonnage basis the West of the Rockies market area statistics were computed by subtracting the Hawaiian Islands metal can shipments for each end use category (shipments of American Can Co. plants in Hawaii) from the metal can statistics covering the west geographic area (States of Washington, Oregon and California) for 1955 as published in the Bureau of the Census, Facts For Industry, Metal Containers Summary, Series 75 D. Statistical data furnished the Department in base boxes of tin plate was converted to a tonnage basis by using conversion factors as published in the Facts For Industry, Metal Container Summary, Series M 34 D.

Since the west geographic area in the Bureau of the Census Facts For Industry tabulations includes the States of Washington, Oregon and California, the shipments from Utah can plants were included in the West of the Rockies market area. In the other States located west of the eastern boundaries of Idaho, Utah and Arizona there were no can manufacturing plants in 1955.

Metal can shipments, by end use categories, for the West of the Rockies market area, was then subtracted from the Continental U. S. total (exclusive of the Hawaiian Islands). The balance is the volume applicable to the East of the Rockies market area.

As mentioned above the computations dividing the East and West areas was accomplished on a tonnage basis. The tonnage was then converted to thousands of units by multiplying the number of cans which might have been produced for each end use category from one short ton of steel consumed (See Annual Reports of Steel and Tin Consumed in Metal Cans published by the Can Manufacturers Institute, Inc. for 1947-1956 and 1948-1957, pages 9, 10 and 11 and 12) and applied to the East and West tonnages.

The conversion factors used for 1955 in converting one ton of steel to can units were as follows:

(a) food containers 9,237 units
(b) beer containers 10,161 units
(c) soft drink containers 11,167 units
(d) non-food containers 7,631 units

Food containers include the following commodity categories:

(a) fruit and vegetables
(b) evaporated milk
(c) other dairy products
(d) fish and seafood
(e) meat
(f) lard and shortening
(g) all other food (including soup and baby food)
(h) coffee

Non-food containers include: pet food, oil, open top (1 qt. and 5 qt.) and all other non-food.

SOURCE: Bureau of the Census, Facts For Industry, Metal Container Summary, Series 75 D.
Data for Continental Can Co. is from DP 2134 through 2176. Metal can statistical data for American Can Co. and National Can Co. are from those companies.

[fol. 1447]

[redacted]

The following companies are included in the shipments by Anchor Hocking Glass Co:

(a) [redacted]
(b) [redacted]
(c) [redacted]

Containers included in the specified group are both narrow mouth and wide mouth glass containers used for household and industrial, utilitarian and decorative, and medicinal and health supplies.

Included in the food group of glass containers are both narrow mouth and wide mouth food, dairy products and packers tumblers.

Data for the Continental Can Co., Hazel-Atlas Division are from the answers to Plaintiff's Interrogatory No. 13. The information furnished reflects sales to customers rather than actual shipments. Plants and warehouses alike are treated as shipping points to which sales are attributed, and interplant shipments are eliminated. The data also contains a small amount of export sales plus other minor variations resulting from lost or misplaced data cards and the use of different methods of handling the data. For a more detailed description of these variations see pages 1 through 4 of the answer to Plaintiff's Interrogatory 13. For these reasons the figures set forth in the answer to Plaintiff's Interrogatory No. 13 do not exactly coincide with the statistical shipment data the Hazel-Atlas Glass Co. furnished the Glass Containers Manufacturers Institute Inc. which the Government used to Publish "G" Statistical Tables. In most instances these differences are minor.

The computation of the West and West of the Rockies section statistics included domestic shipments of glass containers by food, non-food, beer, beverage categories and were consolidated for those companies operating and shipping glass from plants West of the Rockies. This tabulation included the following companies operating plants in the States of California, Washington and Oregon.

Anchor-Hocking Glass Co.
(for its subsidiary Hayward Glass Co.)

Ball Brothers Company

Glass Containers Corporation
(and its subsidiary United Can and Glass Co.)

Continental Can Co., Hazel-Atlas Division
Kerr & Co., Inc. Alexander
Latchford Glass Co.
Northwestern Glass Co.
Owens-Illinois Glass Co.
Thatcher Glass Manufacturing Co.

The differences between the totals for the West of the Rockies section and the totals for the entire Continental United States segments the East of the Rockies section.

For the year 1955 Hazel-Atlas has been listed in third position because of their volume of shipments of all types of glass containers in that year. This does not necessarily mean that Hazel-Atlas ranked third in shipments for all end use categories of glass containers. For example, Hazel-Atlas was not among the first ten in total shipment of beer or beverage bottles. This fact in no way alters the percentage figures for Hazel-Atlas in these two categories.

[redacted]:

Continental United States totals are from the Bureau of Census, Pasts Bar Industry, Glass Containers Summary Series M 32 G and M 77 C.

Company data from:

(a) Glass Container Manufacturers Institute.
(b) Answer to Plaintiff's Interrogatory No. 13.
(c) Copies of monthly reports Series M 77 C made by Owens-Illinois Glass Co. to the Bureau of the Census covering the year 1955.
(d) Letter dated March 2, 1960 to Robert A. Hicks Acting Assistant Attorney General, Antitrust Division from William J. Owen, President, Thatcher Glass Manufacturing Co.
(e) Letter dated April 28, 1960 to Robert A. Hicks Acting Assistant Attorney General, Antitrust Division from William A. Starr, Vice President, Finance, Alexander H. Starr & Co., Inc.
(f) Letter dated February 22, 1960 to Robert A. Hicks Acting Assistant Attorney General, Antitrust Division from Alexander H. Brookes, Vice President and General Counsel Ball Brothers Company.

3d

Shipments of Metal Soft Drink Containers, East of the Rockies, for 1955 Compared with the Leading Manufacturers in that Section

(In Thousands Of Units)

		1955 Volume	Percent
East of the Rockies, Total		254,819	100.0
American Can Co.		128,454	50.4
Continental Can Co.		114,763	45.0
National Can Co.		8,364	3.3
All Other Manufacturers	a/	3,238	1.3

a/ In the East, Central and West geographical areas set forth in the Facts For Industry Metal Cans, Summary For 1955 the end use category for soft drink was consolidated with another end use category entitled, "all other food."
Since the three leading companies manufactured 99.0 of all cans for soft drinks the breakdown East and West of the Rockies was accomplished by selecting the plants of each company manufacturing this product and totaling the shipments from the plants located in each of the two market areas. There were 3238 units that could not be accounted for when comparing the total for all plants to the U.S. total and therefore placed in the East of the Rockies area under the heading "all other manufacturers."

Shipments of Metal Non-Food Containers, East of the Rockies for 1955 Compared with the Leading Manufacturers in that Section

Aerosol Containers—1947, Present and Future

by John M. Heinen, Jr.
Continental Can Company, Inc.
Chicago, Ill.

In the animal world, the ages at which particular breeds come to maturity vary widely. Some turtles, for instance, may be young at the age of 50 years while the entire life span of certain insects may be only a matter of hours or days. So it is in the business world, particularly in the field of packaging. Some excellent ideas never become fully developed; others with little apparent merit may reach general acceptance overnight, only to fade out equally fast; still others enjoy a steady growth and ever-increasing popularity. Take, for example, the aerosol industry, which was mothered by wartime necessity and carefully nurtured by hopeful entrepreneurs in the period immediately following World War II, and now in this its tenth year of commercial acceptance has reached maturity. The name "aerosol" is commonplace today, and, what is more important, people use aerosols, they want them, and they buy them and in rather astounding quantities. Aerosol packages accounted for $320 million last year in the United States alone, and the industry is just beginning to hit its stride. This meteoric rise has been due to steady progress in the development of containers, valves, and propellants as well as continuing advances in product formulation.

General speaking, the term "aerosol" is applied to those products which derive their dispensing pressure from a liquefied gas propellant in direct contact with the product. From a commercial standpoint, foams as well as airborne and surface-deposited sprays of either liquid or powder are properly classified as aerosols. Pressurized food products such as whipped cream use a compressed gas as the propellent—usually a mixture of nitrous oxide and carbon dioxide. Pressure packaging would then be a general term which could apply to all products packed in containers with an internal pressurized atmosphere which serves the purpose of expelling the contents.

Let's take a quick look at the background of this rapidly growing industry, particularly from the standpoint of the container. The story of the development of the original high-pressure "bug-bomb" by Goodhue and Sullivan and its subsequent use by the military during World War II is too well known to be repeated here. Suffice it to say that 40 million 1-lb liquefied gas aerosols were used with striking success.

Even before the end of the war it was quite evident that the heavy, cumbersome, expensive military aerosol bomb would have to be replaced by a much simpler and less costly package if this unique method of dispensing insecticide, and perhaps other products, was to find a place in the civilian market. The container industry picked up the challenge of providing a throw-away container which would retain the convenience aspect and functional characteristics of the heavy welded steel "bug-bombs" but would be light in weight, easy to fill, simple to operate, and above all less costly.

The natural initial choice of a container which would meet these requirements was the beer can, which was in fact a pressure container. It would not, however, withstand the high pressure (70 psi gage at 70F) then in use. The most obvious and practical approach was to reduce the pressure in the aerosol container without sacrificing performance in terms of killing power. The two-piece drawn container made by Crown Can Company offered immediate possibilities. Continental Can Company meanwhile developed the three-piece soldered side seam beer can container into an aerosol container. Our aim was to obtain the

desired killing power of the insecticide by the use of a propellant pressure low enough to permit the use of the cheapest possible container. Strengthening the can body of the three-piece can by structure and manufacturing improvements was relatively simple, but perfecting the valve was another matter. The ideal valve had to: (1) be low in cost, (2) provide a suitable aerosol spray at a lower pressure, (3) provide consistent performance, (4) be readily assembled, and (5) be easily operated. No such valve was available, and entry of the three-piece can on the market was delayed for nearly a year while we designed and built a low cost valve to do the job. The result was Continental's "Fingertip" Dispenser, with a soldered valve which operated at a pressure of 25 to 35 psi gage at 70F and proved to be a highly successful aerosol container for many years. I might add that Continental later went out of the valve business, since other manufacturers soon entered the field and took over the task of designing special purpose valves for the myriad products which followed in the wake of the successful marketing of insecticides.

So much for the historical background. Now what about today's containers? Originally only steel (both tin plate and black plate) met the exacting requirements for aerosols, and the 12-oz size was the standard, adapted from the beer can. Today steel cans are being made in the 3-oz, 6-oz, 8-oz, [fol. 1507] 12-oz, 14-oz and 16-oz sizes. While steel still offers certain advantages, other materials have put in their appearance in the last few years, especially for the smaller sizes. Glass aerosols are on the market, ranging in size from ½-oz to 4-oz. Plastic containers have been made up to 4 oz and are likewise expected to find a place in the market. Small aluminum containers have joined the parade in the United States, and, as you heard yesterday, aluminum containers of many sizes have been in extensive use in Europe for some time.

Packaging requirements are never static. They are constantly changing. When an unromantic, highly utilitarian, and still novel aerosol can containing hair lacquer moved into milady's boudoir, a new and very demanding requirement arrived on the scene. The package now was required to "belong" in a new company, a different room, a different atmosphere. The insecticide can was a misfit here. Em-

phasis was put on appearance. Color, size, symmetry appeal all became very important. In spite of what some husbands may think, the wifely, toil-stained hand that grasps the insecticidal aerosol in the kitchen with deadly intent directed against a meandering fly is not at all the same, soft, carefully-manicured hand that daintily reaches for the aerosol hair lacquer, perfume or anti-perspirant in another part of the house. Likewise, it should be remembered that merchandising has changed drastically over the last 10 years. With the pronounced trend toward supermarkets, we find that the container is the best, and very often the only, salesman. Consequently, size, shape, color, shelf appeal, eye appeal, label attractiveness, symmetry and contour all become important factors to be added to the previous demanding performance requirements of the aerosol container. These are the factors that have led to marked improvements in the steel aerosol container, and these are likewise the factors which have provided the opportunity for glass, aluminum and plastic to join steel in the aerosol container field. All of these offer possibilities for a new and a different look, at a price.

Container requirements for aerosols must be carefully considered, and compromise decisions must be made in order to come up with the best container for the specific purpose, product and market involved. Cost, strength, weight, appearance, cost of handling, ease of handling, ability to be decorated, ease of filling, corrosion resistance, flexibility with respect to different valves, and quality control factors must all be considered in a final analysis of the choice of container for a particular product.

The Future

We who have been a part of this dynamic aerosol industry may be tempted to look back nostalgically at our past achievements. We may sometimes gaze with pride, and perhaps rightfully so, at the tremendous number and variety of aerosol products now occupying the shelves of the hardware stores, the drug stores, the cosmetic counters, the department stores and the supermarkets. But gentlemen, we cannot afford to be complacent. There are still more unexplored opportunities for aerosol packaging. Practically none of the existing markets are saturated, and many others have not even been touched. On the basis

of the present rate of growth, many people have estimated a production of 600 million aerosol units in 1960, and I for one feel that 1 billion units is not too unrealistic. What are some of the things we can expect in the next few years? I have talked recently with many people both within the industry and outside of it, and these are some of the conclusions I have reached:

1. Container Materials

Steel has been the leader, but glass, aluminum, plastic and perhaps paper will be used more extensively. Composite containers—that is, containers made of more than one of these materials—are practically a certainty. The particular properties of each will be used to advantage.

2. Convenience

There is no question that people are getting lazier and lazier and are willing to pay for convenience. Perhaps not so well understood, however, is the fact that the American consumer is not just interested in the gimmick or novelty aspect. He or she is interested in things that will really save time or will offer some other plus factor. Hence, emphasis can be expected on factors that will not only offer initial attraction, but will assist in obtaining repeat business.

3. Appearance

The requirements of the personal cosmetic field as well as supermarket merchandising and the push-button shopping of the future will continue to emphasize the need for visual salesmanship in the container.

4. Shape

While still greater diversity in the shape and size of containers can be expected, it must be remembered that this trend can mean higher costs, and as a result some pressure will be exerted for standardization.

5. Size

In the packaging field, there is generally a marked trend toward unit packaging and multi-unit packaging on the one hand, and toward the large, economy, king-size or house-

hold size package on the other. These cross-trends have already been evident in the aerosol field, and they are expected to continue. The merchandising of functionally related aerosols in kits of two, three or even more containers can be expected.

6. Pharmaceutical Aerosols

This group is still in its infancy, and we can look for tremendous gains in this field in the next few years.

7. Pressurized Foods

The biggest volume gains in the pressurized dispenser industry will perhaps be in the food field. Here is a practically virgin territory, and while many problems are present, the rewards can be very gratifying. As a matter of fact, the successful packaging of pressurized foods other than whipped cream is no longer a dream. Our laboratories, working in cooperation with valve manufacturers and other suppliers, have produced experimentally a complete package which will do the job. Some difficulties yet remain, but these are in the refinement category. Barbecue sauce, meat tenderizer, ice cream topping, table syrup and an endless number of other products are already in the offing. Some of them will be commercial realities before the end of the year.

Having taken a look at the past, present and future of our vigorous industry from the container standpoint, we cannot but be impressed, not only with the progress made during the first 10 years, but also with the opportunities for additional growth in the next.

More and increasingly complex problems will confront the container manufacturer as *new and improved* products attempt to find a place in the aerosol field. Packaging requirements will become increasingly demanding, but your container industry is prepared to meet this challenge and supply you with a steady stream of new, different and improved containers to satisfy your requirements.

[fol. 1508] GOVERNMENT'S EXHIBIT 900

Willkie Owen Farr Gallagher & Walton
15 Broad Street
New York 5, N. Y.

July 18, 1956.

Honorable Victor R. Hansen,
Assistant Attorney General,
Antitrust Division,
Department of Justice,
Washington 25, D. C.

Re: SNB:EJ:WDK 60-0-37, 60-358-34, 60-14-33

Dear Judge Hansen:

On behalf of Continental Can Company, Inc. ("Continental"), we transmit herewith the following information and enclosed exhibits requested by Judge Barnes in his letter dated June 27, 1956 and telegram dated June 29, 1956 concerning, respectively, its proposed acquisition of Hazel-Atlas Glass Company ("Hazel-Atlas") and Robert Gair & Company, Inc. ("Gair"). The Hazel-Atlas closing is scheduled for August 8, 1956; it is contemplated that the Gair closing will take place around or shortly after the middle of September.

Before answering the questionnaire, we shall discuss first the application of the Final Judgment entered June 26, 1950 in U. S. v. Continental Can Company, Inc. to the proposed acquisitions and then Continental's tailor-made packaging concept.

[fol. 1509] Application of Final Judgment to Proposed Acquisitions

Judge Barnes' letter raised the question of the application of the Final Judgment entered June 26, 1950 in U. S. v. Continental Can Company, Inc. to the Hazel-Atlas and Gair acquisitions. More specifically, do glass containers, folding cartons, shipping containers and kraft paper bags come within the scope of "containers" as used in provision 12 of Section II of the Judgment?

We respectfully submit that such containers do not come within the Judgment for the reason (1) that the term "con-

tainers" is confined to those metal (packers and general line cans) and fibre (composite containers, fibre milk bottles and comparable products) containers involved in U. S. v. American Can Campany and U. S. v. Continental Can Company, Inc. ("Can cases") and which were sold by defendants under long-term requirements contracts and closed by closing machines leased to purhasers of such containers; (2) that glass containers, besides not being metal or fibre, were excluded from the Can cases by agreement of counsel; (3) that bags manufactured from a variety of materials, such as paper, foils, cellophane, laminates, glassine, plastics and wax paper, were deemed not covered by the term in a Stipulation and Order (Exhibit 1 signed November 21, 1952 by Hon. George B. Harris, Judge of the United States [fol. 1510] District Court for the Northern District of California, and *a fortiori*, therefore, folding cartons, shipping containers, and kraft paper bags do not come within the Judgment; and (4) that folding cartons, shipping containers and kraft paper bags were not in any way involved in the Can cases.

An examination of the pleadings, including interrogatories and admissions, pre-trial stipulations and orders, the transcript of the American Can trial and the transcript of the hearings pertaining to the framing of the Can Judgments shows that the Can cases and their resulting Judgments were directed at those types of metal cans and fibre containers which defendants manufactured and sold under long-term requirements contracts and which were closed on closing machines under lease to such container purchasers. An examination of the various proceedings before Judge Harris since the entry of the Can Judgments as well as surveys of the Antitrust Division, such as the one now being made, also demonstrates this point.

It is our recollection that during the early informal pre-trial discussions among counsel in the Can cases, the question of the line of commerce for purposes of computation of market participation was raised by defendants' counsel. Their suggestion that glass containers be included in this computation was rejected by Government counsel. Eventually both Government and defendants' counsel at a con-

[fol. 1511] ference* held May 24, 1948 in San Francisco, agreed that:

"5a: 'All containers' appearing in plaintiff's answer to this interrogatory does not include glass."

• • • • • • •

"5c 2: As it appears from the allegations of plaintiff's amended complaint plaintiff limits percentage figures to metal containers."

• • • • • • •

"8 i & j: The percentages referred to are limited to metal containers and metal container closing machinery and plaintiff makes no claim as to percentages of fibre containers or fibre container closing machinery."

The foregoing statements relate to the Government's answers to certain numbered paragraphs [5(a), 5(c)(2), 8(i) and (j)] in interrogatories propounded to the Government by American. Moreover, in a Pre-trial Order signed and filed on August 6, 1948 by Hon. Michael J. Roche, United States District Judge for the Northern District of California, there were stipulations in paragraphs 6 and 7 which defined metal and fibre containers. The substance of these stipulations was that "containers" were confined to metal [fol. 1512] and fibre containers which were sold under requirements contracts and closed by closing machines. To the best of our knowledge, neither American nor Continental manufactured glass containers, folding cartons, shipping containers and kraft paper bags from the time the Government filed its amended complaint on June 7, 1948 to the time that the Judgments were entered in June, 1950.

At the time Continental was considering the acquisition of Benjamin C. Betner Company, a manufacturer of small and medium sized bags from a variety of materials such as paper, foils, cellophane, laminates, glassine, plastics and wax paper, the question of the application of provision

---

* See Statement of Plaintiff Concerning Memorandum of Matters Agreed upon by Counsel for Parties at a Conference Held in Room 230 of the Federal Building, San Francisco, California, on May 24, 1948, pp. 3 and 5.

12 of Section II of the Judgment to this type of container was presented to the Antitrust Division. After the submission of a Memorandum on the subject dated September 23, 1952 and a full discussion of the matter among an official of Continental, Continental counsel and Government counsel from the Legislative and Clearance Section and Judgments and Judgment Enforcement Section, it was decided that "bags" were not containers within the meaning of the Judgment. Pursuant to this determination, a Stipulation and Order (Exhibit 1) was presented to Judge Harris together with a copy of the Memorandum. It was signed and filed with the Memorandum November 21, 1952 with the Clerk of the Court. For your convenience, we set forth [fol. 1513] an excerpt from this Memorandum:

> "Continental, however, is now raising the question whether Betner is a manufacturer of containers within the meaning of the Judgment. If it is, the affirmative showing of the lack of effect on competition would have to be made to the Court. Continental's position is that Betner is not a manufacturer of containers within the meaning of the Judgment. It does not wish, nevertheless, to consummate the acquisition without first presenting the matter to the Antitrust Division.
>
> "The word 'container' is a broad generic term. In common parlance, it embraces practically every conceivable form of receptacle such as barrels, boxes, cartons, cases, trunks, garbage cans, buckets, waste paper baskets, decanters, pots and pans in the kitchen, glass bottles and jars, trays and literally thousands of other products which readily come to mind. In drafting the Judgment, the Court was concerned only with specific types of containers, namely, those containers which were involved in the American and Continental cases; metal cans (general line and packers) and fibre containers (milk bottles and those containers of a comparable nature). This is evident from the transcript which reported the formulation of the Judgment.
>
> "During those proceedings, considerable discussion occurred as to whether the Court intended American's fibre milk bottles to come within the Judgment's definition of containers. Counsel for American urged that it should not, but Mr. Jansen, Counsel for the Govern-

ment, stated (VI Transcript 27, 28): 'It would be a strange fact if the one thing in which American had almost an absolute monopoly, the fibre milk container, were to have no restrictions.'

"Discussion was then had whether Continental's paper cups and plastic containers came within the Judgment. Mr. Jansen readily agreed that they did not, saying (VII Transcript 3): 'They were not in issue in the American Can case. They are not in issue in the [fol. 1514] Continental Can case. We have no objection to spelling that out in the definitions.'

"In short, it seems clear that the prohibition against acquisition of concerns 'in the manufacture for sale of containers' means concerns manufacturing those specific types of containers which were involved in the complaint and in the evidence of the litigation. Containers were narrowed by both Government counsel and the Court to general line and packers metal cans and fibre containers such as milk bottles and the like. These were the containers about which the Government made charges, introduced evidence and helped to formulate a judgment.

"Neither American nor Continental manufactured paper bags or other similar bags produced by Betner at the time of the American litigation or at the time the American and Continental Judgments were entered. Such bags were not in any conceivable way in issue in the proceedings. As a matter of fact, we doubt very much that bags were even mentioned during the trial or during the discussions before the Court on the formulation of the Judgments. Both the Government and the Court recognized that the Judgments should be formulated and construed in the light of the type of containers in issue. Otherwise, the various provisions would not make sense.

"If the Antitrust Division agrees that paper bags do not come within the scope of the Continental Judgment, it will not be necessary to make any presentation to the Court. The matter then could be disposed of by stipulation."

It is our conclusion, therefore, that glass containers, folding cartons, shipping containers and kraft paper bags do

not come within the scope of the term "containers" as used in provision 12 of Section II of the Judgment.

In evaluating the answers to the questionnaire, you may find helpful the following background information on Con- [fol. 1515] tinental's packaging concept and the type of packaging service it seeks to render.

Continental's Tailor-Made Packaging Concept

The development over the years of Continental's operations and products has made its name, Continental Can Company, Inc., something of a misnomer. While metal containers are still the major part of its business, the business is now "tailor-made packaging" for nearly any product.

The enormous growth in packaging, which is sometimes referred to as a "revolution," was foreseen some sixteen years ago by the then Chairman of the Board and Chief Executive Officer, Carle C. Conway. In the Company's 1940 Annual Report, Mr. Conway wrote: "We must give our customers not only value and quality, but an ever-widening variety and improvement in our products. But management must do more than this. It must be creative. Before the product must come the idea, the inspiration for the product, for without such idea there would be no product.

"We are constantly making increased demands on our Research Departments for the study and development of new ideas. We recognize that in the success of these efforts, rests the hope for the continued growth of the Company." [fol. 1516] Mr. Conway not only correctly interpreted the trend toward more and better packaging, but acted upon it, and laid the foundation for Continental's unique position as a company which can provide whatever type of packaging its customers desire, or whatever kind its customers' products may require. In 1942, Continental entered the paper container and fibre drum fields. In 1944, it undertook the manufacture of paper cups, steel pails, and decorated kitchenware. A modern kraft pulp and paper mill was purchased in 1947, to support the rapidly growing fibre drum operations.

When General Lucius D. Clay succeeded Mr. Conway in 1950, a further study of the packaging industry was made. It showed enormous possibilities for future growth, and

emphasized the importance of a broad variety of packaging media to meet the shifting but ever increasing public demand for attractive and functionally effective individual packages, and the requirements of industry for strong, economical bulk shipping containers. Confirmed in the correctness of its earlier decisions, Continental continued its program of increasing the range of packaging services it could offer its customers. In 1953 the Company continued its diversification or broadening program by entering such packaging fields as paper and laminated bags for coffee and other dry products; flexible packaging involving the conversion, extrusion, lamination and printing of cello- [fol. 1517] phane, polyethylene and other materials; plastic products such as squeeze bottles and pipes; and plastic coated paper plates. Early this year, Continental went into the business of manufacturing vacuum type metal closures.

Continental's tailor-made packaging business was developed through external as well as through internal growth. Because each particular packaging field has its own history, technical information, manufacturing skills, trained workers, managerial problems, selling methods and competitive situation, Continental in many instances entered a particular field by acquiring an existing company. In each non-metal packaging venture, as in the can business, Continental has done its utmost to improve the quality of the package and service provided. We believe a study of the industry will show that, without exception, the effect of Continental's entry into a new packaging line has been to sharpen competition. Well-established national and local leaders in individual packaging fields have felt impelled to review and improve their policies on merchandising, pricing and quality to match the type of service offered by Continental. Continental has breathed new life into packaging fields which were slipping. For example, modern fibre drum manufacturing is a long way from old-style cooperage businesses. By the same token, Continental has had to assume substantial financial and managerial risks [fol. 1518] in challenging the well-entrenched positions of the industry leaders, while at the same time meeting its competitive responsibilities as a metal can manufacturer.

Internal growth is responsible for most of Continental's development. For example, in 1955 Continental had in oper-

ation 72 domestic factories. Of these, 42 were built by Continental, while 30 were obtained through acquisitions. Moreover, Continental's 1955 net sales and operating revenues were $666 million. $410 million came from domestic factories which Continental constructed, while $216 million came from domestic factories it acquired. (It should be added that the originally-purchased equipment in these plants has been greatly increased and modernized, at Continental's expense.) It would seem that in an expanding, competitive economy, the balance between internal growth and external growth must be determined by the situation in the market.

The packaging revolution is still in progress, and we believe it has a long way yet to go. The American economic way of life has become a packaged way of life. As a matter of taste, convenience and necessity, the demand for packaging increases each year. Our economic system of mass production and distribution depends to a large extent upon packaging to protect, to help sell, and to provide more satisfaction. In order to complete its diversifica- [fol. 1519] tion program and to render a tailor-made packaging service for any customer who wishes to reach any segment of the market with any type of product, Continental must offer glass jars and bottles, folding cartons, shipping containers and kraft paper bags.

In considering the Hazel-Atlas acquisition, Continental was guided by the respective packaging uses of glass and metal containers, and by the fact that in U. S. v. American Can Company and U. S. v. Continental Can Company, Inc., the Antitrust Division took the position that metal containers and glass containers were separate and distinct lines of commerce and thus defendants in those cases could not combine the two for the computation of market participation. The metal closures of Hazel-Atlas are of a different type from the metal closures of Continental, and do not compete with them. The former are screw and home canning types, while the latter is the vacuum type.

In entering the glass container field, Continental recognizes that it will be competing with three national leaders: Owens-Illinois Glass Company, Anchor-Hocking Glass Corporation and Thatcher Glass Manufacturing Company, Inc. One of these, Owens-Illinois, has a dollar volume of

sales many times that of Hazel-Atlas. In this situation [fol. 1520] Continental hopes to create a degree of competition which Hazel-Atlas alone has not been able to provide.

Continental appreciates that to be successful in the glass container business and to provide effective competition to the industry leaders, it must be in a position to offer a complete line of glass jars and bottles, including beverage bottles. Hazel-Atlas' facilities for the production of beverage bottles are very limited. In order to provide a satisfactory entry into this field, Continental has asked us to inform you in the strictest confidence that it is carefully considering the acquisition of the business of Obear-Nestor, Inc., East St. Louis, Illinois, including its subsidiary, Lincoln Container Company, Lincoln, Illinois, to supplement the lines of Hazel-Atlas. This concern is primarily a beverage bottle manufacturer with combined net sales in 1954 and 1955 of around $15,949,000 and $14,328,000 respectively. It is our intention to discuss this matter with you fully before proceeding with the acquisition.

As far as Robert Gair Company, Inc. is concerned, Continental is not engaged in the manufacture of folding cartons, shipping containers or the type of kraft paper bag manufactured by Gair. While it is true that Continental's only pulp and paper mill, located at Hopewell, Virginia, manufactures paperboard for sale, as do the mills of Gair, yet their combined net sales of paperboard would not exceed about 5% of the total industry sales.* With the addi-

*This estimated figure was derived by using the dollar paperboard shipment figures reported respectively by Continental and Gair to the Department of Commerce for 1954 and 1955 and the total industry dollar paperboard shipment figure for these years as determined by the trade journal Fibre Containers and Paperboard Mills, vol. XI, No. 8, p. 90 (August 1955) and a telephone call from the publisher, Board Products Publishing Co., to Gair on July 13, 1956 reporting the estimated total industry figure for 1955. It is to be noted that Continental and (we are informed) Gair included in reports to the Department of Commerce their respective intra-company sales of paperboard.

[fol. 1521] tion of glass jars and bottles and cartons, shipping containers and kraft paper bags, Continental will have achieved the degree of diversification in the packaging field toward which it has been carefully building for so many years.

Many products now use or can use a variety of different types of packaging. Thus, it is the policy of Continental to encourage its various individual product divisions to push their own particular type of packaging to maximize customer service, volume and profits. This results in strong intra-company competition which in many instances is more effective than outside competition in bringing about the adoption of improved products, cost reductions and better service to customers. It is our belief that the Continental concept of a broad, all-embracing packaging service, provided by vigorous well-managed and adequately financed product divisions, does more to ensure active and effective competition in the national market place than would be possible without the existence of the organization Continental has developed.

[fol. 1522] With this background in mind, we turn to the answers to the questionnaire.

1. A statement of the plan of merger, and copies of all documents and agreements to be utilized and entered into by the two companies in consummating the merger.

(A) Hazel-Atlas

The plan of merger, described by the Purchase Agreement (Exhibit 2) as a tax-free reorganization within the meaning of the Internal Revenue Code, provides that on the Closing Date Hazel-Atlas will convey, transfer, assign and deliver to Continental all the assets, properties, business and good will of Hazel-Atlas and that in consideration thereof Continental will issue and deliver to Hazel-Atlas an aggregate of 999,140 shares of its presently authorized but unissued Common Stock of the par value of $20. per share and will assume all the liabilities and obligations of Hazel-Atlas outstanding on the Closing Date. The Purchase Agreement was signed June 29, 1956, and it is anticipated that the Closing Date will be on or about August 8, 1956.

As a part of the plan, as revealed in the Hazel-Atlas

proxy statement (Exhibit 3), Hazel-Atlas will dissolve and distribute all of the Continental Common Stock received to its stockholders in complete winding up and liquidation and complete cancelation or redemption of its Stock, such distribution to be made promptly after the receipt by Hazel-Atlas of the certificates representing such shares. The [fol. 1523] distribution of the Continental Stock to stockholders of Hazel-Atlas will be at the rate of 46/100ths of a share of Common Stock of Continental for each share of Capital Stock of Hazel-Atlas. Fractional shares of Common Stock of Continental will not be issued, but in lieu thereof cash adjustments will be made. The presently issued and outstanding shares of Common Stock of Continental are, and the shares to be distributed to Hazel-Atlas stockholders will be, listed on the New York Stock Exchange.

(B) Gair

The plan of the merger has not as yet been developed in detail. It would appear that it will take the form of a statutory merger. We shall send you copies of all documents as soon as they are available.

2. A brief physical and functional description of the lines or classes of containers and other articles produced and sold by your company, together with copies of all its current price lists.

Item 2 requests two things: (1) a physical and functional description of Continental's product lines and (2) copies of all current price lists for items within each product line. We are setting forth below part (1) and Continental is in the process of preparing part (2), namely, copies of current price lists, but only for representative and large volume items of each product category. To furnish a price list for every item in each category would call for thousands of documents and would, we believe, serve no useful purpose. If you find that you want a price list for any particular item in any category, Continental will be glad to furnish it upon request.

[fol. 1524]

Product Line	Physical Description	Functional Use
1. Metal Cans	Metal Cans are single-walled containers constructed of tin plate, terne plate, black plate or waste plate and manufactured from steel sheets of 29 gauge or lighter; includes all steel pails produced from steel sheets of 29 gauge or lighter but does not include those produced from steel sheets of heavier than 29 gauge; also excluded are ice cream cans and fluid milk shipping containers.	Used for packaging a variety of food products such as fruits and fruit juices, vegetables, evaporated and condensed milk, meat, fish, coffee, syrup, lard and beer; and non-food products such as motor oil, grease, paint, varnish, polish, waxes, drugs, cosmetics and other products.
2. Steel Pails	Steel pails are single-walled shipping containers with a range of capacity from 1 to 12 gallons inclusive, constructed of steel heavier than 29 gauge; excludes metal cans, terne plate oil containers, fluid milk shipping containers, ice cream cans, gas cylinders, beer barrels, reconditioned pails or containers not commercially usable in the transportation of commodities.	Used for bulk packaging of foods, chemicals, paint and petroleum products.
3. Lithographed Kitchenware (Tin Mill Products only)	Manufactured from lithographed tin mill products into metal housewares items.	Used for canister sets, wastebaskets, trays, step-on cans and bread boxes, and is a consumer line.
4. Military Items	Manufactured from a variety of materials, products range from military adaptations of peacetime containers and packaging to aircraft components, and other defense items. (During World War II, Continental turned over large sections of its machine shops and plants to production for the armed forces, and acted as prime and subcontractor for innumerable war products.)	Containers are used by armed forces for packaging a variety of military products. Also manufactured are V/T fuses, parts for Nike guided missiles, aircraft components, honeycomb and barrier materials.
5. Can Closing Equipment and Parts	Designs and manufactures can closing machines, related equipment, auxiliary equipment and repair parts for lease or sale to packers of a variety of food and non-food products.	Used for the final double seaming or crimping of metal covers to metal cans and to supplement operations of closing cans.

[fol. 1525]

Product Line	Physical Description	Functional Use
6. Metal Closures	Crown caps, manufactured from tin plate into metal shells with plastic or cork liners, the latter being "spotted" with aluminum or vinylite for certain beverages.	Used as caps or closures on beverage bottles by brewers and soft drink bottlers.
	Closures, manufactured of tin plate, sealing compound and paper liners into round metal closures.	Used to seal glass bottles and jars for food packaging, on such products as baby foods, catsup, juices, fruits and vegetables.
7. Cork Products	Imported cork waste is ground for the manufacture of composition cork.	Used as liners for caps and closures in beverage and food industries; as expansion joints in highways, etc., school bulletin boards, gaskets, shoe sole fillers and floor underlayment.
8. Low Pressure Laminates	Reinforced polyester resin laminate, available in roll or sheet form.	Used as a decorative material for surfacing furniture and working surfaces and as insulation for electrical products.
[fol. 1526]		
9. Squeeze Bottles	Custom-made or stock polyethylene bottles in various shapes and sizes, to dispense products via a physical squeeze of the container.	Used mainly for packaging and dispensing of deodorants, cosmetics, nasal sprays and various food products, such as mustard and honey.
10. Injection Molding and Rigid Plastic Containers	Custom-made plastic products of many sizes, shapes and uses.	A variety of plastic products.
	Polystyrene and high impact polystyrene nested containers, with lids of polystyrene and polyethylene.	Rigid plastic containers are suited for the packaging of ice cream, sherbet, cottage cheese, salads, candies and various other food products.
11. Plastic Pipe and Fittings	Saran, butyrate, polyethylene and styrene-alloy plastic pipe in various sizes, with complete line of fittings.	Possesses standard application in petroleum and natural gas industry; for irrigation and drainage lines, chemical and food processing lines, water service, waste and disposal lines.

Product Line	Physical Description	Functional Use
12. Paperboard	Kraft linerboard, kraft paper, .009 corrugating medium, folding boxboard and laminated chipboard.	Linerboard used for outside and inside plies in corrugated shipping cases and for cylindrical sidewalls and bottoms of fibre drums; corrugating medium for the layer inside the two liners in a corrugated shipping case; kraft paper for such purposes as wrappings and bag making, folding boxboard for folding and set-up boxes; laminated chipboard for the bottoms of fibre drums.
13. Paper Products	Fibre drums with cylindrical side-walls convolutely wound of kraft linerboard laminated with adhesive, while top and bottom construction vary from all fibre to all metal.	Used primarily for bulk shipments of dry, solid and liquid products, such as chemicals, plastics, foods, films and metal parts.
	Containers and cups, manufactured of paper with paper or metal lids. Nesting type containers are single or double-wrapped in tub or tumbler shapes. Cylindrical containers are spiral wound and have slip-over lids.	Containers are used for packaging salads, ice cream, cottage cheese and other dairy products, while the tumbler-shaped cups are used for hot and cold drinks.
	Consumer plates and cups, manufactured of paper.	Used by consumers primarily for picnic use.
	Paper specialty packaging envelopes in machine-folded sizes, from 1 x 1 inch to 16 x 20 inches, in various shapes.	Used to package miscellaneous products like seeds, scissors, saw blades, dyes and powdered foods.
	Kraft paper bags, unlined or lined with glassine paper, films and foils.	Used for the packaging of dry products such as coffee, insecticide, fertilizer, pet food, chemicals.
14. Flexible Packaging	Manufactures, converts and prints basic flexible packaging materials (films, foil and paper), supplying each, or a lami-	Used for packaging foods, chemicals, textiles, photographic supplies and various other types of prod-

[fol. 1527]

3. Lithographed Kitchenware (Tinmill Products only)

1. National Can Corp.
2. Continental Can Co.—20%
3. Nesco, Inc.
4. Harvell Manufacturing Corp.
5. Parker Metal Decorating Co.

[fol. 1532] 4. Military Items

Because of the large number of suppliers furnishing directly or indirectly a wide variety of military items to the Government, Continental has no way of determing its participation.

5. Can Closing Equipment

1. American Can Company
2. Continental Can Co.*
3. National Can Corp.
4. Crown Cork & Seal Co.
5. Angelus Can Machinery Co.
6. Baldwin-Lima-Hamilton Corp.
7. Max Ams

6. Metal Closures

1. Crown Cork & Seal Co.
2. Continental Can Co.—18.8%
3. Owens-Illinois Glass Co.

---

*Figures are not available to Continental for determining its percentage participation in this line. The order of rank after Continental is only an estimate.

4. Anchor-Hocking Glass Corp.
5. Ball Bros. Co.

7. Cork Products

Continental's cork production is an adjunct to its crown manufacturing function. Commercial sales account for less than 5% of industry volume. Continental has insufficient knowledge of primary commercial operations in this field to be able to rank companies by size.

8. Low Pressure Laminates and

10. Injection Moldings and Rigid Plastic Containers

These two lines are minor with the company. They cover a variety of products. Continental has insufficient knowledge of primary manufacturers to rank them. Continental's sales volume is estimated to be less than 1% in the injection moldings field and less than 3% in the high and low pressure laminates field.

9. Squeeze Bottles

1. Plax Corp.
2. Injection Molding Corp.
3. Royal Manufacturing Co.
4. Continental Can Co.—9.3%
5. Bradley Container Corp.

[fol. 1533] 11. Plastic Pipe and Fittings

Continental is no longer engaged in manufacturing plastic pipe. During the period of its activity in this field, it was about No. 10 in order of rank. The field has received recently a number of new entries, including the steel companies.

12. Paperboard

Paperboard is not a major company line. Continental's sales represent less than 2% of industry production. Because its knowledge of major commercial operations is limited, Continental is unable to rank the leaders in this field by sales volume.

13. Paper Products

A variety of products is included here. For most of these, Continental's sales represent less than 1% of industry volume. Fiber drums and paper cups, plates and nested containers account for nearly 80% of its business in this category.

Major companies in the paper cup, plate and nested container industry follow in order of estimated rank:

1. Lily-Tulip Cup Corp.
2. Dixie Cup Co.
3. Sutherland Paper Co.
4. Continental Can Co.—11.5%
5. Diamond Match Co.

Major companies in the fibre drum industry follow in order of estimated rank:

1. Continental Can Co.—82.3%
2. Grief Bros. Cooperage Corp.
3. Rheem Mfg. Co.
4. Master Package Corp.
5. Fibre Drum Co.

14. Flexible Packaging

The products of this industry include packages and packaging materials in a wide variety of forms made from both converted and unconverted materials such as cellophane, polyethylene, other transparent films, foils, specialty papers, and laminations. Because of the industry's diverse nature, Continental is unable to develop a meaningful industry dollar estimate of sales.

[fol. 1534] 7. A statement of the patent positions of your company on these products.

1. Metal Cans

Although Continental has approximately 160 unexpired patents relating to metal cans, not including patents covering methods or apparatus for their manufacture, the over-all picture is that neither Continental nor any other company in the industry is in a position to prevent competitors from manufacturing metal cans.

2. Steel Pails

Continental does not have any patents in the steel pail field.

3. Lithographed Kitchenware

Continental has only three patents in this field and these are insignificant. One, for instance, is a design patent and another covers a refuse container. Continental is not a position, therefore, to prevent anyone from continuing to operate in this field or from entering it.

4. Military Items

Continental has three insignificant patents in this field. Its patent position, therefore, would prevent no one from competing with it in any of the military products which it manufactures.

5. Can Closing Equipment

Continental patents on can closing machines, related equipment and auxiliary equipment are largely controlled by Section IV of the Final Judgment entered June 26, 1950 in U. S. v. Continental Can Company, Inc. Continental holds about 62 patents. These are improvement patents since all basic have expired. As a consequence, Continental has no control which would prevent others from manufacturing, selling, leasing or using closing equipment.

[fol. 1535] 6. Metal Closures

Crown Caps

Continental has about 41 patents. These include crown cap patents, whether relating to spotting machines or methods of placing spots on cork discs or counters, or methods for compound lining crowns. While Continental's Pearson spotting machine patent does an excellent job here, it will expire August 29, 1956. Furthermore, in order to use it without engaging in infringement litigation, Continental has been paying Crown Cork & Seal Company a royalty at the rate of ⅛¢ per gross for many years. Although Continental has several method patents covering the

lining of crown shells with a compound, others are not prevented from using a compound in a shell. It is true, however, that they would have to employ a method different from Continental's, as for example, the Dewey & Almy method.

It is believed that Continental has a slight edge on its competitors in compound lining crown shells. On the other hand, none of its patents would prevent anyone from producing crown caps with a cork liner, either spotted or unspotted.

Vacuum Metal Closures

Continental has approximately 26 unexpired patents. On the whole, caps similar to the well-known White Cap can be produced by others without patent infringement. It is not believed that Continental has a position in the vacuum type metal closure field which would prevent vigorous competition.

7. Cork Products

In this field Continental has a patent expiring this year covering an extruder for cork sheets; two 1943 patents covering cork rod extruders; and a 1945 patent covering a cork rod extruder. Its position, therefore, is such that it would be unable to prevent the manufacture of cork sheets or slabs or cork rods by others.

[fol. 1536] 8. Low Pressure Laminates

Continental has 8 patents in this field. One of these covers continuous lamination. Continental has licensed three competitors under this patent and has even extended the offer to license others who make resin impregnated laminates.

This patent would not prevent others from producing laminates. However, for the manufacture of laminates containing a polyester resin in a continuous manner, it is believed that the patent is fairly broad in its coverage.

9. Squeeze Bottles

Continental has four patents. One of these covers a specific atomizing structure in a squeeze bottle, but

there are ways of avoiding this patent. The other three cover the apparatus and method for manufacturing bottles.

Summed up, while Continental believes it has a good method and machine for producing squeeze bottles, its position could not prevent others from entering and practicing in this field.

10. Injection Molding and Rigid Plastic Containers

Injection Molding

In this field Continental has three patents relating only to minor improvements in preheating molding powders, cure testing and injection molding. It also has an exclusive license under 2 product patents and one pending application for the manufacture and sale of a turret seal spout. For this one spout, Continental believes its license is valid. Its patent position, however, in injection moldings is insignificant.

Rigid Plastic Containers

Continental has no patents.

11. Plastic Pipe and Fittings

Continental has one patent covering an injection unit for a molding machine. It is insignificant.

[fol. 1537] 12. Paperboard

Continental has two patents relating only to the production of paper laminated structures. It has no patents relating to the manufacture of paperboard. Its position, therefore, is such that it would be unable to prevent the manufacture of paperboard of any kind.

13. Paper Products

Fibre Drums

Continental has approximately 18 patents in this field, none of which could be construed as basic in any degree. In other words, Continental would not be in a position to prevent others from manufacturing fibre drums unless they infringed specific patent claims.

Nested Containers and Cups

Continental does not have any patents on paper cups per se. The only patent in this field is one covering an automatic machine for manufacturing cone-shape paper cups, which by no means dominates this type of cup. Others in the field have been producing it for years.

Thus, patentwise in this field Continental is not in a position to prevent anyone from making nested paper containers and cups.

Consumer Plates and Cups

Continental's patent position in the field of consumer paper plates and cups is not such that it could prevent others from producing paper plates. It has no patent protection on consumer paper cups.

Packaging Envelopes

Continental's position in the packaging envelope field is such that it cannot prevent anyone from manufacturing packaging envelopes.

[fol. 1538] Kraft Paper Bags

Continental has a patent on a method for producing bags which are principally used for the packaging of coffee. This method patent, however, does not prevent others from producing bags for the packaging of coffee. As a matter of fact, there are other such bags which are being produced today in competition with Continental's.

14. Flexible Packaging

In this field Continental has approximately 120 patents. These include, in addition to article patents, machines and methods for producing flexible packages and printing rolls. None of these patents, it is believed, prevent others from manufacturing rolls of flexible material or flexible containers whether they are paper bags, cellophane bags, polyethylene bags, etc. The patents are, generally speaking, directed to specific structures or apparatus or method for making

them. The claims of these patents, of course, would prevent others from employing them, but there are diverse other ways of producing flexible packages. Continental also has a patent covering a heating element and assembly for the deposition of metals by thermo vaporization of metal in vacuo from the surface of such heating element. The patent is used to assist in the deposition of metal on flexible materials. This patent does not place Continental in a position to prevent its competitors from depositing metals on flexible materials by vaporization.

8. Copies of the annual report, income statement and balance sheet for your company for the past three years.

Attached hereto as Exhibits 5(a), 5(b) and 5(c) are copies of Continental's annual report for the past three years.

9. Copies of the minutes of meetings of the boards of directors, executive committees and finance committees of your company concerning the merger.

Exhibit 6(a) consists of two certified copies of portions [fol. 1539] of the minutes of meetings of the Board of Directors held May 16, and June 20, 1956, as well as an uncertified copy of a portion of the minutes of a meeting of the Board of Directors to be held on July 18, 1956. We did not wish to delay this letter until certification after the meeting. A certified copy, however, will be available if desired. Exhibit 6(b) is a copy of a portion of the minutes of a meeting of the Executive Committee of the Board of Directors held June 13, 1956. Both Exhibits pertain to the acquisition of Hazel-Atlas.

Exhibits 7(a) and 7(b) are certified copies of portions of the minutes of a meeting of the Board of Directors held June 20, 1956 and of a meeting of the Executive Committee of the Board of Directors held July 11, 1956, respectively, with regard to the acquisition of Gair.

10. A brief description of previous mergers and acquisitions of your company.

Chartered in 1913 to succeed, among others, Continental Can Company, producing metal cans since 1905, Continental Can Company, Inc. entered an industry which was dominated by American Can Company. Through natural expan-

sion and through a number of acquisitions, Continental furnished the competition with which American had not [fol. 1540] hitherto been confronted. The purpose and effect of this growth was to increase competition in the entire can making industry.

Continental's acquisitions from 1923-1944 enabled it to engage in the manufacture of new types of general line cans, to compete in localities not previously serviced, as the Pacific Coast and the Gulf Coast, and to expand production. In only a few cases, and then to a minor extent, had there existed any competition between Continental and the company acquired. In such instances, competition in the industry was never lessened but was vigorously continued and expanded under Continental's efficient management.

As far as we can determine from presently available records, all of Continental's significant acquisitions of can making facilities from 1920 through 1944 were taken up with the Department of Justice or reported to the Federal Trade Commission. In many of these acquisitions, as for example, Owens-Illinois Can Company in October 1944, clearance was obtained from the Department of Justice. It was the position of the Department and the Commission that the can making industry should have at least one concern which could compete effectively against American Can Company.

Around 1939 or 1940, Mr. Conway conceived the idea of furnishing a "tailor-made packaging service" for almost [fol. 1541] every product. Accordingly, the acquisitions from 1942 to date, with the exceptions of Owens-Illinois Can Company and Val Vita Food Products Company,* were exclusively in packaging lines other than the metal can one. Attached hereto is a summary description (Exhibit 8) of these acquisitions.

11. A list of directors, officers and major stockholders of your company and their connection with other companies in comparable fields.

---

*Val Vita had operated a can making line to furnish cans for its own food packing business. In 1943 Continental purchased the can making machinery and equipment when Val Vita found it unprofitable to make its own cans.

We are enclosing a list of Continental's Directors and Officers (Exhibit 9) and major stockholders (Exhibit 10). As explained on July 6, 1956 to Mr. Ephraim Jacobs on the telephone, that part of the question asking for "their connection with other companies in comparable fields" is difficult to answer with certainty and within a short time for the reason that each must examine his security portfolio and then communicate with each concern in which stock is held to determine the various products manufactured. We experienced this last May 1956 in connection with Continental's response to a Grand Jury subpoena duces tecum in connection with the Kraft paper investigation. If you find that you need specific information with respect to any Director or Officer, Continental will be glad to furnish it.

[fol. 1542] As a result of an arrangement reached with the New York Field Office of the Antitrust Division pertaining to the Grand Jury subpoena, we discovered that the following Officers and Directors owned stock in these paper companies:

Name	Status	Shares	Company
C. E. Eggerss	Officer	558	Waldorf Paper Products
R. L. Perin	Officer	1,220	Champion Paper Company
E. R. Van Meter	Officer	210	Eastern Corporation
Paul C. Cabot	Director	1,250	International Paper Company
		500	West Virginia Pulp & Paper Company
W. I. Myers	Director	100	St. Regis Paper Company

It is the best judgment of Continental's management that no Officer or Director has a sufficient number of voting shares in a competitor which would be of sufficient size to influence the corporate policies of Continental or the competitor.

If you need any further information, please do not hesitate to communicate with us.

Sincerely yours, Willkie Owen Farr Gallagher & Walton.

Federal Bureau of Investigation

Date 8/30/60.

The following items were purchased at the Safeway Store, 4015 Wisconsin Avenue, N. W., Washington, D. C., on August 26, 1960. This store is a large supermarket located on a heavily traveled street in residential Washington, D. C.:

One can Libbys tomato juice	$ .35
One glass bottle Ritters tomato juice	.31
One glass jar whole onions	.31
One can superfine whole onions	.18
One glass jar cut green beans	.43
One can cut green beans	.27
One glass jar asparagus spears	.49
One can asparagus tips	.35
One glass jar sliced beets	.19
One can sliced red beets	.13
One can Whitehouse apple sauce	.15
One glass jar Mott's apple sauce	.19
One can superfine diced carrots	.10
One glass jar diced carrots	.19
One can olive oil	.75
One glass bottle olive oil	.15
One can Peter Pan peanut butter	.89
One glass jar Peter Pan peanut butter	.41
One can Pomona pimientos	.29
One glass jar Pomona pimientos	.23
One can Scamper liquid for dishwashing	.34
One plastic container Lux liquid soap for dishes	.37
One can Breath O Pine all purpose cleaner	.29
One bottle all purpose texize cleaner	.39
One bottle Windex	.15
One can Windex	.59
One bottle Old English furniture polish	.15
One can of Johnson's Pledge furniture polish	1.39

It is to be noted that a number of items were purchased in the smaller size in the interest of economy.

On 8/26/60 at Washington, D. C.
By SA Laurence E. Danbom:pjt.

[fol. 1544] The amount of the purchases made at the Safeway Store amounted to $10.01. This receipt was identified and turned over to Antitrust Division Attorney William H. McManus on August 31, 1960.

[fol. 1545] Federal Bureau of Investigation

Date 8/30/60.

The following items were purchased from the Giant Supermarket, Newark Avenue and Wisconsin Avenue, N. W., Washington, D. C., on August 26, 1960. The Giant Food Store is a large modern supermarket located on a corner of two heavily traveled streets and is located in a residential and commercial section of Washington, D. C. The following items were purchased:

One plastic container Dial shampoo	$ .57
One bottle Halo shampoo	.60
One Sutton Stick deodorant (bottle)	.76
One (plastic) Mennen spray deodorant	.66
One Ipana Plus dentifice (plastic)	.99
One can Colgate Dental Cream	.88
One can Noxon metal polish	.39
One bottle Easy Off Oven Cleaner	.69
One plastic Beam Oven and Grill Cleaner	.98
One can Parson's ammonia	.29
One bottle Parson's ammonia	.15
One Hot Shot bug killer (bottle)	.89
One Hot Shot bug killer (can)	1.29
One (can) Simoniz Body Sheen	1.49
One (plastic) Johnsons Holiday Cream	1.79
One (bottle) Savoy Car Shampoo	.69
One Esquire shoe polish (bottle)	.29
One can Esquire boot polish	.29
One can Easy-on spray starch	.69
One bottle Perma starch	.62
One bottle sauerkraut	.29
One can sauerkraut	.22
One bottle sweet peas	.23
One can sugar peas	.19
One can baked beans	.15
One glass jar baked beans	.27
One can green ripe olives	.49

One jar green olives	.25
One can Snow's Clams	.39
One bottle whole clams	.45
One jar whole mushrooms	.27
One can mushrooms	.39
One can Oregon Purple Plums	.18

On 8/26/60 at Washington, D. C.
By SA Laurence E. Danbom:pjt.

[fol. 1546] One jar Del Monte Deluxe Plums	$ .31
One glass jar fruits for salad	.39
One can fruits for salad	.27
One can pears	.27
One jar pears	.35
One can Kadota figs	.18
One jar Kadota figs	.35
One can Del Monte Boysenberries	.19
One jar Del Monte Boysenberries	.35
One can Borden Instant Malted Milk	.47
One jar Carnation Instant Malted Milk	.47
One jar peanuts	.65
One can peanuts	.35
One jar Wesson oil	.31
One can Crisco	.31

Many of the items purchased at this store were of the small size and this was done in the interest of economy.

The amount of these purchases totaled $23.82. The receipt was identified and turned over to Antitrust Division Attorney William H. McManus on August 26, 1960.

[fol. 1547] Federal Bureau of Investigation

Date 8/30/60.

The following items were purchased at the Giant Food Store, Newark Avenue and Wisconsin Avenue, N. W., on August 29, 1960. This is the same supermarket from which other items were purchased on August 26, 1960. The following items were purchased:

One Johnsons Pride Wax in bottle	$ .79
One Griffin Aersol can shoe polish	.89
One jar Prince spaghetti sauce	.37

One can Progresso spaghetti sauce	.25
One jar Prince Ravioli with meat in sauce	.43
One can Progresso Ravioli with meat in sauce	.37
One can Oregon Purple Plums	.18
One can dark cherries	.39
One jar dark cherries	.43
One bottle apple juice	.20
One can apple juice	.33
One can Sun Sweet prune juice	.17
One bottle Sun Sweet prune juice	.45
One jar Nescafe Instant Coffee (glass)	.39
One can Nescafe Instant Coffee	.79
One bottle Root Beer	.10
One can Root Beer	.09
One can King Syrup	.39
One bottle King Syrup	.25

The total amount of purchases made at the Giant Food Store on this date totaled $7.36. This receipt was identified and turned over to Antitrust Division Attorney William H. McManus on August 29, 1960.

[fols. 1626-1627] GOVERNMENT'S EXHIBIT 1178B

United States Department of Justice
Federal Bureau of Investigation

Report of: SAA Albert A. Hustedt
Date: August 31, 1960
Field Office File No.: Los Angeles 60-602
Office: Los Angeles, California
Bureau File No.: 60-4975
Title: Continental Can Company, Inc., Et al
Character: Antitrust

Synopsis: Investigation at five leading chain grocery stores and five leading independent grocery stores in the Los Angeles area, identified 83 types of the same product which appear in cans and glass containers; 10 types in glass and plastic containers; 8 types in cans and plastic containers; and 15 types in cans, glass, and plastic containers.

P

Details: This investigation was predicated upon receipt of a letter dated August 22, 1960, from Mr. Robert A. Bicks, Assistant Attorney General, Antitrust Division. Mr. Bicks requested that investigation be conducted in the Los Angeles area in order to identify as many products as possible which are packaged in a combination of two or more of the following containers: cans; glass; or plastic.

On August 29, 1960, Leo R. Gilleran, Controller, Ralphs

Grocery Company, 3410 West 3rd Street, Los Angeles, California, was interviewed by SA's Albert A. Hustedt and Harry A. Kerley. * * *.

[fol. 1628] Federal Bureau of Investigation

Date August 31, 1960.

Arthur G. Goertzen, manager of store #32 of Ralphs Grocery Company, located at 3rd Street and Vermont Avenue, Los Angeles, * * *.

ANNUAL REPORT OF STEEL AND TIN CONSUMED IN METAL CANS

FOR THE YEARS
1948 - 1957, INCLUSIVE

CAN MANUFACTURERS INSTITUTE, INC.
821 FIFTEENTH STREET, N.W.
WASHINGTON 5, D.C.

[fol. 1691]

CMI CAN MANUFACTURERS INSTITUTE, INC.

821 15th ST. N.W. WASHINGTON 5, D.C.

PREFACE

More than forty billion cans were produced in 1957. Compared with 1956, the biggest year in can making, there was a drop of almost 4%. Compared with 1955, however, there was an increase of nearly 3%.

Due to unfavorable weather that sharply cut canning crops, fruit & vegetable cans, which require nearly one third of all the steel consumed, decreased 8.4% from the 1956 tonnage figure. Some classifications showed an increase over 1956; these were Beer, Soft drink, Coffee, Pet food, and Fish and seafood.

The Geographical area in which the greatest number of cans were produced, is the East North Central, followed by Pacific and Hawaii. Each of these districts used more than a million tons of steel last year, and together they produced slightly more than one half of all the cans made.

The amount of tin used is estimated. The figures shown, however, are believed to be as nearly correct as any that could be obtained.

CAN MANUFACTURERS INSTITUTE, INC.

May, 1958

WILLIAM J. MILTON, PRESIDENT ROGER F. HEPENSTAL, VICE PRESIDENT H. FERRIS WHITE, EXECUTIVE DIRECTOR

Definition of a Metal Can

A single-walled container constructed wholly of tin plate, terne plate, blackplate or waste plate designed for packing products.

This definition does not include ice cream cans, fluid milk shipping containers or steel pails, defined as single-walled shipping containers having capacities of 1-12 gallons inclusive, that are cylindrically constructed of steel sheet of 29 gauge and heavier.

Coverage

All commercial and captive plants known to be producing metal cans.

Statistics were compiled from reports submitted by the manufacturers to the Bureau of the Census. Data are reported in terms of base boxes of steel consumed, and these base boxes are converted into short tons of steel by the Bureau of the Census, on the basis of conversion factors shown on page 3.

[fol. 1713] GOVERNMENT'S EXHIBIT 1205

Explanation for Filling Out GCMI Reporting Form 1-54

1. Classification by Product Groupings

It is desirable to have as accurate a classification by end use as is feasible. The attached schedule (revised 1/30/53), "Glass Container Industry Product Groups", gives a general definition of the product end use groupings. Also, a partial list of specimen products under the various groupings is given as a guide.

2. Differentiation between Narrow Neck and Wide Mouth Containers

The attached schedule, "Designation of Wide Mouth and Narrow Neck Containers", previously issued 11/2/50, should be used as a basis for distinguishing between these two types of containers. The differentiation is based upon the relationship of size of finish to the capacity, and the basic formula has long been used in the industry. Included in the table are examples of containers classified according to the formula.
The table is not applicable to dairy products containers which should continue to be designated as Wide Mouth, as heretofore.

3. Shipment Column

Where containers are manufactured and shipped to another glass container manufacturer the shipment should be reported the same as shipments to a packer or bottler. If your *Summary of Shipments* for the month includes sales of containers *purchased* from another glass container manufacturer, the total of such purchases should be deducted in arriving at your Shipments Total. The shipment figure should be a net figure, i.e., less any returns.

4. Export Shipments

All shipments to points outside of the continental United States and District of Columbia should be reported as one total under line 20, "Export Shipments".

5. Production Column

The production figure should reflect all ware packed. In order not to distort the Pounds Packed figure and Calculation of Average Weight Per Gross the normal adjustments due to losses or gains should be handled under the "Finished Stocks on Hand" column, as set forth below.

6. Finished Stocks on Hand Column

This figure should be adjusted to reflect losses due to ware culleted, various overs and unders, etc. The calculated finished stock figure then will differ from the actual figure reported only to the extent of the net adjustments.

12/16/57

[fol. 1714] Glass Container Industry Product Groups

Narrow Neck Containers

1. Foods

This classification applies to all narrow neck bottles for commercial food packers. Specimen products are:

catsup
edible oils
concentrated beverage syrup
flavoring extracts
fruit juices
syrups
vegetable juices
vinegars

2. Medicinal & Health Supplies

This classification applies to narrow neck containers for products which are primarily intended to improve or maintain the health of human beings or animals. Specimen products are:

Citrate of magnesia
essential oils
extracts for
medicinal purposes
liniments

liquid soaps
nursing bottles
oral preparations—hygienic
peroxide
pharmaceuticals
prescription bottles
proprietary medicines
veterinary supplies

3. Chemical, Household & Industrial

This classification applies to all narrow neck containers for products not used in connection with human or animal bodies. It includes all containers used for manufactured articles such as soap dispensers, as well as for such products as the following:

ammonias
bleaches
bluings
cements
cleaning fluids
disinfectants
dyes
embalming fluids
glues
individual creamers
inks
insecticides
lubricating oils
polishes
protective coatings
refrigerator water bottles
waxes

4. Toiletries & Cosmetics

This classification applies to all narrow neck containers for products intended primarily to improve personal appearance or to impart a pleasing odor. Specimen products are:

[fol. 1715] bath salts and oils
brilliantines
cuticle products

deodorants
hair tonics
lotions
nail polishes
perfumes
powders
toilet waters

5. Beverages * Returnable

This classification applies to all bottles for soft drinks and water, carbonated or not carbonated, designed for multiple-trip use.

6. Beverages * Non-Returnable

This classification applies to all bottles for soft drinks and water, carbonated or non-carbonated, designed for single-trip use.

7. Beer * Returnable

This classification applies to all bottles for alcoholic cereal beverages (beer, ale, porter, etc.) designed for multiple-trip use.

8. Beer * Non-Returnable

This classification applies to all bottles for alcoholic cereal beverages designed for single-trip use.

9. Liquors

This classification applies to all bottles designed for bottling alcoholic beverages except wines and malt beverages. Included are such products as brandies, cordials, gins, rum and distilled spirits.

10. Wines

This classification applies to all bottles designed for bottling all types of wines, whether sparkling or still, and champagnes and vermouths.

Wide Mouth Containers

11. Foods

This classification applies to all wide mouth containers sold to commercial food packers. Specimen products are:

baby foods
candies
coffee
edible oils
fish products
fruits
jams & jellies
mayonnaise & salad dressings
meat products
mustard
peanut butter
pickles & relishes
preserves
shortenings
syrups
vegetables

Also included under this classification are: home canning jars for fruits and jellies, as well as packers tumblers.

[fol. 1716] 12. Medicinal & Health Supplies

This classification applies to all wide mouth containers for products which are intended to improve or maintain the health of human beings or animals. Specimen products are:

capsules
chemicals
pharmaceuticals
prescription ware
proprietary medicines
tablets
veterinary supplies

13. Chemical, Household & Industrial

This classification applies to all containers for products not intended for use in connection with human or animal bodies. It includes all containers used for manufactured articles, such as oil stove reservoirs, as well as such products as the following:

cements
embalming fluids
industrial chemicals
inks
pastes
protective coatings
polishes
snuff
tobacco jars

14. Toiletry & Cosmetics

This classification applies to all wide mouth containers for products intended primarily to improve personal appearance or impart a pleasing odor. Specimen products are:

bath salts
brilliantine
creams (except medicated protective creams)
pomades
talcum powders

15. Dairy Products

This classification applies to all containers used by dairies. It includes milk and cream bottles, and it also includes cottage cheese jars, orange and chocolate drinks when not in narrow neck beverage bottles.

16. Total Domestic

17. Export

This classification applies to any of the above shipped to packers and bottlers outside the continental limits of the United States.

[fol. 1718] GOVERNMENT'S EXHIBIT 1209

Continental Can Company, Inc.

Notice and Proxy Statement for Special Meeting of Common and Preferred Stockholders To Be Held October 26, 1956

[fol. 1719] 4. Business of Continental

Continental was incorporated under the laws of the State of New York on January 17, 1913. The principal business of Continental and its subsidaries is the manufacture and sale of metal cans and other metal containers. Other products include paper containers, fibre drums, kraft linerboard, flexible packaging materials, crown and vacuum caps, plastic products, and can closing machinery. In addition, as described under the heading "Acquisition of Hazel-Atlas Glass Company", Continental has entered the glass container field. In 1955 sales of cans and other metal containers accounted for between two-thirds and three-fourths of the total sales in dollar volume of Continental. With respect to each of the major lines of products manufactured by Continental, there are several other important suppliers of the same or similar products. Thus, in each case Continental must meet vigorous competition in price, quality and service.

Continental is also engaged in the manufacture of special defense products. Sales of these defense products constituted approximately 5% of the gross sales of Continental in 1955. In general, defense contracts of Continental may be terminated for the convenience of the United States Government. The profits on these sales are comparable to profits on sales of other products manufactured by Continental.

The major portion of the business is conducted directly by Continental. Its principal subsidiaries, all of which are wholly-owned, are The Container Company, Continental Can Company of Canada Limited, Continental Can Corporation, Continental-Shellmar Incorporated, Continental-[fol. 1720] Shellmar International Company, Inc. and White Cap Company. It also has subsidiaries, wholly or partially owned, in Mexico, Colombia, Venezuela, Panama and Brazil. References herein to the business of "Continental" are to the business as conducted by the enterprise as a whole. Continental operates through the following operating Divisions: Metal, Crown and Cork, Paper Container, Fibre Drum, Paperboard, Shellmar-Betner, Canadian, Overseas, Equipment Manufacturing and Hazel-Atlas. Each operating division is headed by either a vice president or a general manager, who is responsible for all phases of the operation

of the particular division. Continental also operates through the White Cap Company, a wholly-owned subsidiary which Continental acquired on January 4, 1956.

Metal Division

Continental manufactures and sells a diversified line of cans and other metal containers and operates 40 plants in the United States for this purpose. It is the second largest manufacturer of such containers in the United States.

The greater portion of the metal container sales consists of cans used for the packaging of a wide variety of food products, such as fruits and fruit juices, vegetables, evaporated and condensed milk, meat, fish, coffee, syrup, lard and beer. The remainder of its metal container sales normally consists of cans and containers used for the packaging of other products, such as motor oil, grease, paint, varnish, polish, wax, drugs, cosmetics, detergents and other products.

The principal materials used for the manufacture of metal cans and containers are tin plate, terne plate and black plate, all requirements of which are purchased from nonaffiliated sources.

Most of the output of metal cans and containers is sold directly through Continental's own sales organization to canners and industrial users. Sales are made mainly under standard forms of contracts which are entered into for a one-year period for all or a portion of the customer's requirements. Such contracts establish prices which are adjustable in the event of changes in prime material costs and certain taxes or customs duties without notice, and changes for other reasons, including wage rates, upon notice.

Crown and Cork Division

This division has five plants for the manufacture of crown caps. The Wilmington plant, in addition to manufacturing crown caps, purchases and grinds cork for Continental's requirements, and also manufactures and sells certain cork products such as washers, gaskets, expansion joints, rods and discs. Continental is the second largest producer of crown caps in the United States. This division also manufactures plastic products in two plants.

Paper Container Division

This division has six plants for the manufacture of paper containers used by the food and dairy industries and in the retail food-dispensing fields, and beverage cups used in coin operated vending machines. Its products include cottage cheese tubs, cold drink cups, hot drink cups and paper plates of various types and sizes. Sales are made both through wholesalers and directly to users.

[fol. 1721] Fibre Drum Division

Continental manufactures various types of fibre drums at six plants. The fibre drums range in size from less than a gallon to 75 gallons, and are principally used for shipping dry products such as chemicals and powdered milk. Continental is the largest producer of fibre drums in the United States. Most sales are made directly to users.

Paperboard Division

Continental operates a paper mill at Hopewell, Virginia, which manufactures kraft linerboard and paper. A considerable part of its production is currently used by Continental's fibre drum plants, the remainder being sold to others. Continental is presently installing a semi-chemical pulp operation in the Hopewell plant which will permit the use of hardwoods available in the area. Continental owns extensive timberlands in Virginia and North Carolina.

Equipment Manufacturing Division

Continental maintains four machine shops which manufacture the greater portion of its can making machinery and which also manufacture can closing machinery which is sold or leased to customers and others.

Shellmar-Betner Division

The Shellmar-Betner Division manufactures and converts flexible packaging materials. It operates eight plants in which it extrudes and laminates polyethylene, and prints and converts into bags and containers various types of films and other materials. This Division offers its customers a great variety of flexible packages and packaging materials including specially designed gravure printed packaging.

White Cap Company

On January 4, 1956, Continental acquired all of the capital stock of the White Cap Company which now operates as a wholly-owned subsidiary. White Cap Company has a modern plant in Chicao, Illinois, and has been highly successful in the manufacture and sale of vacuum type metal closures.

Hazel-Atlas Glass Division

This Division has been organized to carry on and develop the business formerly conducted by Hazel-Atlas Glass Company as described under the heading "Acquisition of Hazel-Atlas Glass Company."

Canadian Division

Continental's operations in Canada are operated through its Canadian Division. This division manufactures and sells metal containers and paper containers, including cold drink cups and hot drink cups, and crown caps of various types and sizes. It operates nine plants.

[fol. 1722] Overseas Division

Foreign activities other than Canadian operations and a can and crown closure plant operated in Cuba by the Metal Division are conducted by the Overseas Division. These include licensee service arrangements with 28 firms in 22 countries in the fields of can, crown caps, flexible packaging, paper container and fibre drum manufacture. Flexible packaging converting plants are operated in Mexico and South America.

Miscellaneous

On June 28, 1956 Continental purchased 50% of the outstanding capital stock of Cochran Continental Container Corporation, a Delaware corporation, recently organized to engage in the manufacture and fabrication of aluminum foil containers. Cochran Foil Company of Louisville, Ky. owns the other 50% of such outstanding capital stock.

Continental maintains an extensive servicing force to provide complete cannery equipment and can handling services for its customers and others.

Continental maintains sales offices throughout the United States. It carries on research and experimental work in connection with its products and the materials used therein,

as well as with respect to the operations of its customers. Several laboratories are maintained for this purpose, two of which, located in Chicago, Illinois, employ approximately 600 persons, including graduate chemists, bacteriologists, engineers and physicists. In all Continental employs approximately 45,000 persons.

In addition to its foreign operations described above, Continental is a shareholder in many of the leading container manufacturing companies in principal foreign markets throughout the world and regularly receives dividends from these investments.

5. Acquisition of Hazel-Atlas Glass Company

On September 13, 1956 Continental acquired all of the assets, properties, business and good will of Hazel-Atlas Glass Company, a West Virginia corporation (herein called "Hazel-Atlas") in exchange for an aggregate of 999,140 shares of Common Stock of Continental and the assumption by Continental of all of the liabilities of Hazel-Atlas, as provided in a Reorganization Agreement and Plan dated June 29, 1956, between Continental and Hazel-Atlas. Hazel-Atlas thereafter commenced proceedings to dissolve and distribute the Common Stock of Continental received by it in liquidation to its stockholders. The Hazel-Atlas operations are now being conducted as a division of Continental.

The Division manufactures glass containers and glassware, including tumblers, tableware and kitchenware and articles of special design for industrial use. It also manufactures metal closures for glass containers. It operates plants at 13 locations and maintains leased warehouses at six [fol. 1723] locations. Its principal customers are manufacturers and packers of cosmetics, medicinal preparations and food and other products and wholesalers and distributors of glass jars for home canning.

The management of Hazel-Atlas believed it to be the third largest glass container manufacturer in the United States in terms of dollar volume of sales, but the leader in the industry had a sales volume several times that of Hazel-Atlas.

Separate financial statements of Hazel-Atlas are included elsewhere in this proxy statement.

On September 10, 1956 the United States of America filed Civil Action 112-387 against Continental and Hazel-Atlas in

the United States District Court for the Southern District of New York alleging in substance that the acquisition by Continental of Hazel-Atlas would have the effect of lessening competition in violation of Section 7 of the so-called Clayton Antitrust Act. On September 13, 1956 the Court denied the Government's request that a temporary restraining order be issued against the acquisition, and the acquisition was consummated on that date. However, the Civil Action remains pending.

HAZEL-ATLAS GLASS COMPANY

NOTICE OF SPECIAL MEETING OF STOCKHOLDERS

To the Stockholders of
HAZEL-ATLAS GLASS COMPANY:

Notice is hereby given that a Special Meeting of the Stockholders of Hazel-Atlas Glass Company will be held at the principal office of the Company, 15th and Jacob Streets, Wheeling, West Virginia, at 11 A. M., Eastern Daylight Time, on August 7, 1956, for the following purposes:

(1) To vote upon a proposal (a) to ratify and approve the Reorganization Agreement and Plan, dated June 29, 1956 (herein called the "Plan"), between the Company and Continental Can Company, Inc., a copy of which (without exhibits) is attached hereto as Exhibit A, and to authorize the conveyance, assignment, transfer and delivery of all assets, properties, business and good will of the Company to Continental Can Company, Inc. in exchange for an aggregate of 999,140 shares of Common Stock of Continental Can Company, Inc., and the assumption by that corporation of all of the liabilities of the Company, all as provided in the Plan; and (b) to authorize any and all action necessary to effectuate said Plan. (Proposal 1)

(2) If, and only if, Proposal 1 shall be adopted by the necessary vote of stockholders, to vote upon a proposal that, as provided in the Plan, the Company be liquidated and dissolved and that the shares of Common Stock of Continental Can Company, Inc. be distributed to the stockholders of the Company. (Proposal 2)

(3) To transact such other business as may properly come before the meeting or any adjournments thereof.

In accordance with the provisions of the By-Laws, the Board of Directors has fixed the close of business on July 6, 1956, as the record date for the determination of the holders of Capital Stock entitled to notice of and to Vote at said Special Meeting.

Your attention is directed to the accompanying Proxy Statement.

IN VIEW OF THE FACT THAT PROPOSAL 1 AND PROPOSAL 2 ABOVE REQUIRE THE AFFIRMATIVE VOTE OF THE HOLDERS OF AT LEAST SIXTY PER CENT OF THE OUTSTANDING STOCK OF THE COMPANY, STOCKHOLDERS WHO DO NOT EXPECT TO ATTEND THE MEETING IN PERSON ARE URGED TO COMPLETE, DATE, SIGN AND MAIL THE ENCLOSED PROXY AS PROMPTLY AS POSSIBLE IN THE ENCLOSED STAMPED ENVELOPE.

By order of the Board of Directors.

N. G. Ross, *Secretary.*

Dated, Wheeling, West Virginia,
July 6, 1956.

[fol. 1725] 3220

PROXY STATEMENT

HAZEL-ATLAS GLASS COMPANY

SPECIAL MEETING OF STOCKHOLDERS

August 7, 1956

---

1. PURPOSE OF MEETING

The purpose of the meeting is to vote upon the following proposals:

Proposal 1: To ratify and approve the Reorganization Agreement and Plan, dated June 29, 1956 (herein called the "Plan"), between the Company (herein called "Hazel-Atlas") and Continental Can Company, Inc. (herein called "Continental"), and to authorize the conveyance, assignment, transfer and delivery of all assets, properties, business and good will of Hazel-Atlas to Continental in exchange for an aggregate of 999,140 shares of Common Stock of Continental and the assumption by that corporation of all of the liabilities of Hazel-Atlas, all as provided in the Plan, and to authorize any and all action necessary to effectuate said Plan.

Proposal 2: To authorize the liquidation and dissolution of Hazel-Atlas and the distribution of the shares of Common Stock of Continental to the stockholders of Hazel-Atlas, as provided in the Plan.

Proposal 2 will not be considered at the meeting unless Proposal 1 shall be adopted by the necessary vote of stockholders.

Hazel-Atlas has issued and outstanding 2,172,045 shares of Capital Stock, each of which is entitled to one vote. The affirmative votes of the holders of at least sixty per cent of the issued and outstanding shares of Capital Stock will be required for the approval of both Proposal 1 and Proposal 2. If the holders of at least sixty per cent of the Capital Stock vote in favor of both of the Proposals, such vote will be binding upon all the stockholders of Hazel-Atlas.

The Plan was negotiated by the management of the two corporations in order to make it possible for one enterprise to provide a practically complete packaging service. It will permit the stockholders of Hazel-Atlas to become participants in a more fully integrated business, with anticipated economies in administration, financing, manufacturing and merchandising. The number of shares of Continental to be exchanged for the assets of Hazel-Atlas is equivalent to 46/100th share of Continental for each share of Hazel-Atlas, which was approximately the relative market value of the shares of the common stocks of the two companies at the time of the negotiations. In the negotiations, however, consideration was also given to the capital requirements of Hazel-Atlas in the near future and that these requirements would, in all probability, necessitate lower dividends for the next few years at least. The management believes that the Plan is advantageous to the stockholders of Hazel-Atlas and recommends that it be ratified and approved.

THE MANAGEMENT STRONGLY RECOMMENDS A VOTE IN FAVOR OF BOTH PROPOSALS.

[fol. 1726] 2. SUMMARY OF THE PROPOSALS AND OF THE PLAN

The Plan, which it is proposed to ratify and approve, provides that on the Closing Date specified therein, Hazel-Atlas will convey, transfer, assign and deliver to Continental all the assets, properties, business and good will of Hazel-Atlas, and that in consideration of the conveyance and transfer of such assets and properties Continental will issue and deliver to Hazel-Atlas an aggregate of 999,140 shares of its presently authorized but unissued Common Stock of the par value of $20 per share, and will assume all of the liabilities and obligations of Hazel-Atlas outstanding on the Closing Date (Proposal 1). Subject to the provisions of the Plan relating thereto, it is anticipated that the Closing Date will be on or about August 8, 1956. Under the Plan, and as part thereof, Hazel-Atlas will dissolve and distribute all the shares of Common Stock of Continental received by it to its stockholders in complete winding up and liquidation of Hazel-Atlas and complete cancellation or redemption of its stock, such distribution to be made promptly after the receipt by Hazel-Atlas of the certificates representing such shares (Proposal 2). The distribution of the shares of Common Stock of Continental to stockholders of Hazel-Atlas will be at the rate of 46/100 of a share of Common Stock of Continental for each share of Capital Stock of Hazel-Atlas. Fractional shares of Common Stock of Continental will not be issued, but in lieu thereof cash adjustments will be made. The presently issued and outstanding shares of Common Stock of Continental are, and the shares to be distributed to Hazel-Atlas stockholders will be, listed on the New York Stock Exchange. The capitalization of Continental is set out in its Balance Sheet at December 31, 1955 (at page 23), to which reference is made.

The assets to be conveyed by Hazel-Atlas to Continental pursuant to the Plan will include all assets and property owned by Hazel-Atlas on the Closing Date. From and after the Closing Date, Continental will assume and agrees to pay, perform and discharge all debts, obligations and liabilities of Hazel-Atlas and the expenses and costs incurred in connection with the distribution to the stockholders of Hazel-Atlas of the shares of Continental, and in connection with the dissolution and liquidation of Hazel-Atlas. The only obligations of Hazel-Atlas which will exist after the Closing Date will be its obligations to distribute to its stockholders the shares of Continental received by it under the Plan, and to dissolve.

The Plan contains certain representations and warranties by Hazel-Atlas with respect to its due incorporation and existence, its capital stock, statements of its financial position and of income and accumulated earnings, absence of undisclosed liabilities, title to its assets and properties, patents, insurance policies, contracts, litigation, and other matters. In the Plan, Continental also makes certain representations and warranties, among which are representations with respect to its organization and existence, its capital stock, its balance sheet and other financial statements, and to the effect that the shares of Common Stock of Continental deliverable pursuant to the Plan, when issued and delivered, will be validly issued and outstanding shares of Continental, full paid and non-assessable except to the extent provided in Section 71 of the New York Stock Corporation Law in respect of debts, wages or salaries due and owing to Continental's laborers, servants or employees. The representations and warranties of both Hazel-Atlas and Continental will be terminated and extinguished by the closing under the Plan.

The obligations of both companies under the Plan are subject to certain conditions which are set forth therein.

Both Continental and Hazel-Atlas are subject to court decrees rendered in antitrust proceedings brought by the Department of Justice. The Department of Justice has requested from both companies information relating to their businesses and to the proposed transaction; it has specifically stated, however, that such request did not imply that the transaction would violate the antitrust laws or the existing court decrees. Insofar as the information requested is available to the respective companies, it will be furnished to the Department of Justice.

A copy of the Plan (without exhibits) is attached hereto as Exhibit A, to which reference is made for a complete statement of the terms thereof.

Tax Status

In the opinion of counsel for Hazel-Atlas consummation of the Plan will result in a reorganization within the meaning of the Internal Revenue Code of 1954 and will not result in taxable income to Hazel-Atlas, and the stockholders of Hazel-Atlas who will receive shares of Common Stock of Continental in exchange for their stock in Hazel-Atlas will not have any taxable gain or deductible loss pursuant to such exchange other than such gain or loss as will be recognized to the extent that cash adjustments will be made by reason of the sale of fractional interests in Common Stock of Continental for the account of stockholders of Hazel-Atlas.

3. BUSINESS OF HAZEL-ATLAS

Hazel-Atlas is a manufacturer of glass containers and glassware, including tumblers, tableware and kitchenware and articles of special design for industrial use. It also manufactures metal closures for glass containers. It operates plants at 13 locations and maintains leased warehouses at six locations. Its principal customers are manufacturers and packers of cosmetics, medicinal preparations and food and other products and wholesalers and distributors of glass jars for home canning.

In all of its product lines the business of Hazel-Atlas is subject to keen competition. In terms of dollar volume of sales, its management believes it is the third largest glass container manufacturer in the United States, but the leader in the industry has a sales volume several times that of Hazel-Atlas. In recent years, there has been an increasing use of improved automatic machinery in the industry and a considerable part of Hazel-Atlas's products must be made by such machinery. If it is to maintain its relative position in the industry in the next few years, it must make large capital investments in additional machinery and in plants and other equipment.

4. BUSINESS OF CONTINENTAL

Continental Can Company, Inc. was incorporated under the laws of the State of New York on January 17, 1913. The principal business of Continental and its subsidiaries is the manufacture and sale of metal cans and other metal containers, paper containers, fibre drums, kraft linerboard, flexible packaging materials, crown and vacuum caps, plastic products, and can closing machinery. In 1955 sales of cans and other metal containers accounted for between two-thirds and three-fourths of the total sales in dollar volume of Continental. With respect to each of the major lines of products manufactured by Continental, there are several other important suppliers of the same or similar products. Thus, in each case Continental must meet vigorous competition in price, quality and service.

Continental is also engaged in the manufacture of special defense products. Sales of these defense products constituted approximately 5% of the gross sales of Continental in 1955. In general, defense contracts of Continental may be terminated for the convenience of the United States Government. The profits on these sales compare favorably with the profits on sales of other products manufactured by Continental.

The major portion of the business is conducted directly by Continental. Its principal subsidiaries, all of which are wholly-owned, are The Container Company, Continental Can Company of Canada, Limited, Continental Can Corporation, Continental-Shellmar Incorporated, Continental-Shellmar International Company, Inc. and White Cap Company. It also has subsidiaries, wholly or partially owned, in Mexico, Colombia, Venezuela, Panama and Brazil. References herein to the business of "Continental" are to the business as conducted by the enterprise as a whole. Continental operates through the following operating Divisions: Metal, Crown and Cork, Paper Container, Fibre Drum, Paperboard, Shellmar-Betner, Canadian, Overseas and Equipment Manufacturing. Each operating division is headed by either a vice president or a general manager, who is responsible for all phases of the operation of the particular division. Continental also operates through the White Cap Company, a wholly-owned subsidiary which Continental acquired on January 4, 1956.

Metal Division

Continental manufactures and sells a diversified line of cans and other metal containers and operates 40 plants in the United States for this purpose. It is the second largest manufacturer of such containers in the United States.

The greater portion of the metal container sales consists of cans used for the packaging of a wide variety of food products, such as fruits and fruit juices, vegetables, evaporated and condensed milk, meat, fish, coffee, syrup, lard and beer. The remainder of its metal container sales normally consists of cans and containers used for the packaging of other products, such as motor oil, grease, paint, varnish, polish, wax, drugs, cosmetics and other products.

The principal materials used for the manufacture of metal cans and containers are tin plate, terne plate and black plate, all requirements of which are purchased from nonaffiliated sources. A number of the materials used by Continental in the manufacture of metal containers are purchased from producers of steel and steel products who are currently subject to an industry-wide strike. Unless the steel strike is of extreme duration, it is not anticipated that it will have a serious effect upon the business and operations of Continental because with respect to all such materials Continental believes it has acquired sufficient reserves.

Most of the output of metal cans and containers is sold directly through Continental's own sales organization to canners and industrial users. Sales are made mainly under standard forms of contracts which are entered into for a one-year period for all or a portion of the customer's requirements. Such contracts establish prices which are adjustable in the event of changes in prime material costs and certain taxes or customs duties without notice, and changes for other reasons, including wage rates, upon notice.

Crown and Cork Division

This division has five plants for the manufacture of crown caps. The Wilmington plant, in addition to manufacturing crown caps, purchases and grinds cork for Continental's requirements, and also manufactures and sells certain cork products such as washers, gaskets, expansion joints, rods and discs. Continental is the second largest producer of crown caps in the United States. This division also manufactures plastic products in two plants.

Paper Container Division

This division has six plants for the manufacture of paper containers used by the food and dairy industries and in the retail food dispensing fields and beverage cups used in coin operated vending machines. Its products include cottage cheese tubs, cold drink cups, hot drink cups and paper plates of various types and sizes. Sales are made both through wholesalers and directly to users.

Fibre Drum Division

Continental manufactures various types of fibre drums at six plants. The fibre drums range in size from less than a gallon to 75 gallons, and are principally used for shipping dry products such as chemicals and powdered milk. Continental is the largest producer of fibre drums in the United States. Most sales are made directly to users.

Paperboard Division

Continental operates a paper mill at Hopewell, Virginia, which manufactures kraft linerboard and paper. A considerable part of its production is currently used by Continental's fibre drum plants, the remainder being sold to others. Continental is presently installing a semi-chemical pulp operation in the Hopewell plant which will permit the use of hardwoods available in the area. Continental owns extensive timberlands in Virginia and North Carolina.

Equipment Manufacturing Division

Continental maintains four machine shops which manufacture the greater portion of its can making machinery and which also manufacture can closing machinery which is sold or leased to customers.

Shellmar-Betner Division

The Shellmar-Betner Division manufactures and converts flexible packaging materials. It operates eight plants in which it extrudes and laminates polyethylene, and prints and converts into bags and containers various types of films and other materials. This Division offers its customers a great variety of flexible packages and packaging materials including specially designed gravure printed packaging.

White Cap Company

On January 4, 1956, Continental acquired all of the capital stock of the White Cap Company which now operates as a wholly-owned subsidiary. White Cap Company has a modern plant in Chicago, Illinois, and it has been highly successful in the manufacture and sale of vacuum type metal closures.

Canadian Division

Continental's operations in Canada are operated through its Canadian Division. This division manufactures and sells metal containers and paper containers, including cold drink cups and hot drink cups, and crown caps of various types and sizes. It operates nine plants.

Miscellaneous

Continental maintains an extensive servicing force to provide complete cannery equipment and can handling services for its customers and others.

Continental maintains sales offices throughout the United States. It carries on research and experimental work in connection with its products and the materials used therein, as well as with respect to the operations of its customers. Several laboratories are maintained for this purpose, two of which, located in Chicago, Illinois, employ approximately 600 persons, including graduate chemists, bacteriologists, engineers and physicists. In all Continental employs approximately 35,000 persons.

In addition to its Canadian business, Continental has other foreign operations. Its Cuban business is operated through the Metal Division. Its other foreign operations include exporting, rendering technical service and advice under agreements with several foreign manufacturers, and manufacturing, principally flexible packaging materials, in Mexico and South America.

3. PLANTS OF CONTINENTAL

The principal plants of Continental and its subsidiaries are listed below. All plants are well maintained and in good operating condition. Except as indicated, all plants are owned by Continental or its subsidiaries.

METAL DIVISION

Auburndale, Fla.
Baltimore, Md. (2) (one leased)

6. DESCRIPTION OF COMMON STOCK OF CONTINENTAL

Continental is authorized by its Certificate of Incorporation, as amended, to issue 150,000 shares of Preferred Stock without par value (herein sometimes called the "Preferred Stock"), 145,650 shares of Second Preferred Stock without par value (herein sometimes called the "Second Preferred Stock" and together with the Preferred Stock herein sometimes collectively called the "Preferred Stocks") and 10,000,000 shares of Common Stock of the par value of $20 per share. The Preferred Stock and the Second Preferred Stock are issuable in series, and the Board of Directors is authorized to fix, with respect to each series, the number of shares and the designation of such series, the annual dividend rate of the particular series and the date from which dividends shall accumulate, the redemption price for the particular series, the terms of any sinking or similar fund, and conversion or exchange rights, if any. There are authorized and issued 150,000 shares of $3.75 Cumulative Preferred Stock without par value. 145,650 shares of Second Preferred Stock without par value are authorized but unissued.

Dividend Rights

Subject to the limitations described under the subheading "Limitations on the Payment of Dividends" and subject to the prior rights of the Preferred Stocks to receive cumulative dividends, holders of Common Stock of Continental are entitled to dividends as declared by its Board of Directors. The current quarterly dividend on the Common Stock is 45¢ per share.

Limitation on the Payment of Dividends

Under the terms of the indenture between Continental and J. P. Morgan & Co. Incorporated, Trustee, dated November 1, 1955, which is the most restrictive of the various indentures or other instruments relating to Continental's debt securities, Continental may not expend for the payment of dividends or the purchase, redemption or retirement of its capital stock amounts which would exceed in the aggregate the sum of the following: (a) $10 million, (b) the net amount of cash received by Continental for the sale or issue of its shares after December 31, 1954, and (c) the consolidated net income of Continental after December 31, 1954 (or minus the consolidated net loss after said date, as the case may be). As of December 31, 1955, after providing for the foregoing test, and after provision for full cumulative dividends on the issued and outstanding $3.75 Cumulative Preferred Stock without par value to said date, Continental had approximately $21,400,000 available for dividends on its Common Stock.

Provisions of the Certificate of Incorporation of Continental, as amended, relating to the Preferred Stocks also impose restrictions upon the payment of dividends on the Common Stock. Such provisions are not, however, as restrictive as the restrictions imposed by the indenture above referred to.

None of the restrictions described above applies to dividends payable on the Common Stock in shares of Common Stock.

Voting Rights

Holders of Common Stock have one vote per share and, except as described below or provided by law, have exclusive voting power.

If at any time dividends on the Preferred Stock are in arrears in an amount equal to four quarterly dividends thereon, holders thereof voting as a class, irrespective of series, have the right to elect three Directors to serve in place of three of the Directors theretofore elected or entitled to be elected by the holders of Common Stock. Under similar circumstances, holders of Second Preferred Stock voting as a class, irrespective of series, have the right to elect three such Directors. In each case, such voting power and the terms of office of such Directors shall terminate upon the payment of all dividends in default on the Preferred Stock or the Second Preferred Stock, as the case may be.

The Certificate of Incorporation, as amended, of Continental, restricts the taking of certain corporate action without the prior consent of the holders of at least 66⅔% in interest of the Preferred Stock and the Second Preferred Stock, respectively, in each case voting as a class, including among other things, the amendment of provisions of the Certificate of Incorporation so as to affect such stocks adversely, the authorization of additional shares of stock ranking prior to or on a parity with the Preferred Stock or the Second Preferred Stock, the sale, lease or conveyance of substantially all of the property of Continental, and, in certain instances, merger into or consolidation with another corporation. The amended Certificate of Incorporation also restricts the taking of corporate action without prior consent of the holders of at least a majority in interest of the Preferred Stock and the Second Preferred Stock, respectively, in each case voting as a class, including, among other things, the creation or issue of any funded debt (except for refunding purposes), the creation of any mortgage, lien or charge upon the assets of Continental (with certain exceptions), the giving of certain guaranties, and, in certain instances, the issuance of stock or funded debt by subsidiaries.

Liquidation Rights

The holders of shares of Preferred Stock of any series are entitled in preference to holders of any class of stock junior thereto, to receive, in the event of involuntary dissolution, liquidation or winding up of Continental, $100 per share, and, in the event of voluntary liquidation $110 per share, plus, in each case, an amount equal to unpaid accrued dividends.

The holders of shares of Second Preferred Stock of any series are entitled in preference to holders of any class junior thereto, to receive in the event of involuntary dissolution, liquidation or winding up of Continental, $100 per share plus accrued dividends, and, in the event of voluntary liquidation an amount equal to the redemption price of such Second Preferred Stock, otherwise than for any sinking or similar fund, on the liquidation date.

Upon any dissolution, liquidation or winding up of Continental, or any proceedings resulting in any distribution of all of its assets to its stockholders, after payment in full to holders of the Preferred Stock and the Second Preferred Stock, of the amounts to which they are entitled, the remaining assets of Continental are to be distributed among the holders of Common Stock, according to their respective interests.

Miscellaneous

The Common Stock has no conversion rights, and there are no redemption or sinking fund provisions applicable thereto. The Common Stock is not liable to assessment or further calls, except to the extent provided by Section 71 of the New York Stock Corporation Law in respect of debts, wages or salaries due and owing to laborers, servants or employees.

The Certificate of Incorporation, as amended, of Continental contains no provision with respect to preemptive rights and, accordingly, the holders of Common Stock are entitled to such preemptive rights as are conferred by the laws of the State of New York. [Section 39 of the New York Stock Corporation Law provides that in the case of the proposed issuance by a corporation of its "equity shares" or of "voting shares" (as therein defined) of any class or any securities convertible into or carrying options to purchase such shares, the holders of equity shares or voting shares shall have the right, if such proposed issuance would adversely affect the unlimited dividend rights and voting rights of such holders, to purchase, at a not less favorable price than such shares are to be offered to others, such shares as nearly as practicable in such number as would, if such preemptive right were exercised, preserve the relative unlimited dividend rights and voting rights of such stockholder. Section 39 also provides that certain shares or securities, such as shares issued to effect a merger or for a consideration other than cash, or shares previously reacquired by the corporation after having been duly issued, shall not be subject to preemptive rights. The Common Stock of Continental constitutes Continental's only equity shares and voting shares as defined in such statute. Holders of Common Stock have no other preemptive rights.]

The by-laws of Hazel-Atlas provide for the election of a full board of directors annually, whereas Continental's directors are elected for a three-year term, and it would thus require a minimum of two years to replace a majority of the directors of Continental. At its last annual meeting of its stockholders, however, Continental announced plans to change the method of electing its directors so that all directors would be elected each year. It is anticipated that this change will be begun in 1957 and completed two years later.

Continental

The following summary shows the net sales and net income, the earnings applicable to Common Stock and the earnings per share of Common Stock of Continental and consolidated subsidiaries for the years 1951 to 1955, inclusive. For further details with respect to the three years ended December 31, 1955 reference is made to the financial statements of Continental and the notes thereto included elsewhere in this proxy statement.

For the Year ended December 31	Net Sales and Operating Revenues*	Cost of Goods Sold and Operating Expenses*	Selling and Administrative Expenses(1)*	Other Income*	Income Deductions*	Income before Income and Excess Profits Taxes*	Provision for Income and Excess Profits Taxes(2)*	Net Income*	Earnings Applicable to Common Stock*	Earnings per share of Common Stock(3)
1951	$460,595	$406,324	$22,075	$3,765	$1,975	$33,986	$18,775	$15,211	$14,582	$2.30
1952	476,885	426,943	23,188	3,227	2,213	27,768	13,380	14,388	13,381	2.11
1953	554,437	492,410	30,332	2,857	3,121	31,431	15,750	15,681	14,833	2.14

* 000 omitted.

(1) Includes provision for doubtful accounts.

(2) Includes provision for excess profits taxes as follows: $1,975,000 in 1951; $539,000 in respect of subsidiaries in 1952 less a carry-back claim for refund of excess profits taxes in 1952 of $1,150,800; and $425,000 in respect of subsidiaries in 1953.

(3) Based on number of shares outstanding at the end of the periods indicated adjusted to reflect the distribution by Continental on February 15, 1956 of one additional share of its Common Stock for each share then outstanding.

(4) Normally because of seasonal variations Continental does its heaviest volume of business in the second and third quarters of each calendar year. In the first quarter of 1956 the volume of business and net income of Continental were substantially above that of the first quarter of the year 1955.

Hazel-Atlas

The following summary shows the net sales and net income and the earnings per share of Capital Stock of Hazel-Atlas for the fiscal years 1951 to 1955 inclusive, and for the 22 weeks ended June 2, 1956. For further details with respect to the three years and 22 weeks ended June 2, 1956, reference is made to the financial statements of Hazel-Atlas and the notes thereto included elsewhere in this proxy statement.

For the Fiscal Year	Net Sales*	Costs and Operating Expenses*	Selling and Administrative Expenses*	Income Before Taxes on Income*	Provision for Income and Excess Profits Taxes*(1)	Net Income*	Per Share of Stock
1951	$69,884	$57,637	$5,053	$7,402	$4,037	$3,370	$1.55

1954	79,474	63,393	6,662	7,431	3,803	3,629	1.67
1955	79,920	66,610	6,630	6,995	3,602	3,393	1.56
22 weeks ended June 2, 1956 (2)	31,496	27,128	3,065	1,390	725	664	.31

* 000 omitted.

** 53 week year.

(1) Includes excess profits tax of $257,000 in 1951, and a refund of excess profits tax of $250,000 in 1952.

(2) The volume of business and net income of Hazel-Atlas for the twenty-two weeks ended June 2, 1956 were substantially below that of the equivalent period of the preceding year. In part this is attributable to an extraordinarily heavy volume of purchases by customers of Hazel-Atlas during the period preceding January 1, 1956 at which time a previously announced price rise was put into effect by Hazel-Atlas.

Summary of Combined Earnings

The following summary combines the amounts in the foregoing summaries for the years indicated.

	Net Sales*	Cost of Goods Sold and Operating Expenses*	Selling and Administrative Expenses, etc.*	Income Before Taxes on Income*	Provision for Income Taxes, etc.*	Net Income*	Earnings Applicable to Common Stock*	Earnings per Share of Common Stock (1)	Earnings per 40/100ths Share
1951	$530,479	$463,961	$25,338	$41,393	$22,812	$18,581	$17,952	$2.45	$1.13
1952	547,796	486,873	27,708	33,432	16,088	17,344	16,337	2.22	1.02
1953	633,687	559,235	36,834	38,011	19,218	18,793	17,945	2.27	1.04
1954	695,338	606,631	40,651	48,368	24,003	24,366	23,744	2.86	1.32
1955	746,186	643,951	47,283	55,267	27,702	27,565	27,003	3.24	1.49

* 000 omitted.

(1) Based on the number of shares outstanding at the end of the periods indicated, adjusted to reflect the distribution by Continental on February 15, 1956 of one additional share of its Common Stock for each share then outstanding, plus 999,140 shares issuable to Hazel-Atlas pursuant to the Plan.

Comparative and Pro Forma Book Values

The aggregate book value attributable to the Capital Stock of Hazel-Atlas as of December 31, 1955 was $34,973,128 and the per share book value of such stock as of said date was $16.10.

The aggregate book value attributable to the Common Stock of Continental as of December 31, 1955, was $218,280,685 and the per share book value of such Common Stock on said date, adjusted to reflect the distribution by Continental on February 15, 1956 of one additional share of its Common Stock for each share then outstanding, was $29.80.

The pro forma aggregate book value attributable to the Common Stock of Continental as of December 31, 1955 after giving effect to the transactions described in Note 1 to the Pro Forma Balance Sheet of Continental as of said date (at page 18) would be $267,350,063, and the pro forma per share book value of such Common Stock after giving effect to such transactions would be $30.58.

With respect to all information contained under this heading reference is made to the financial statements of Continental and Hazel-Atlas and the notes thereto included elsewhere in this proxy statement.

8. RANGE OF SECURITY PRICES

The Capital Stock of Hazel-Atlas and the Common Stock of Continental are listed on the New York Stock Exchange. The high and low sales prices of such stock on such exchange by quarterly periods during the calendar years 1954 and 1955 and for the first quarter of 1956, as reported in *Bank & Quotation Record*, and for the period from April 1, 1956 to June 22, 1956 were:

Year	Hazel-Atlas Stock		Continental Common	
1954	**Low**	**High**	**Low***	**High***
First Quarter	18⅛	20½	27¼	31
Second Quarter	18¼	20	30 1/16	35 1/16
Third Quarter	19¼	21⅞	34¼	38¾
Fourth Quarter	20	23⅜	34	39⅞
1955				
First Quarter	22	24⅞	36 9/16	41¼
Second Quarter	21¼	24⅜	37 9/16	42½
Third Quarter	21⅜	24¼	36 1/16	40⅞
Fourth Quarter	20¾	22⅞	36⅛	44¼
1956				
First Quarter	20⅝	21⅜	39	44¾
April 1 to June 22	19¾	22⅛	42¾	50

* All prices up to February 15, 1956 are adjusted to give effect to 100% Stock Distribution on outstanding Common Stock of Continental made on that date.

[fol. 1735] 3230 9. INTERESTS OF CERTAIN PERSONS

The table below sets forth the number of shares of Hazel-Atlas Capital Stock beneficially owned as of June 15, 1956 by each Director of Hazel-Atlas, including those Directors who are also officers of Hazel-Atlas. No other active officer owned more than 750 shares of Capital Stock of Hazel-Atlas as of said date.

Directors	Shares of Hazel-Atlas Stock Beneficially Owned As of June 15, 1956
O. P. Decker	1,000
H. W. Gee	3,000
W. W. Holloway	11,425
S. O. Laughlin, Jr.	5,615
H. G. Lewis (1)	500
J. H. McNash (2)	23,400
L. C. Paull	7,700(4)
B. H. Seabright	6,000
K. B. Weaver (3)	1,730

(1) Also Executive Vice-President of Hazel-Atlas.

(2) Also Chairman of the Board and President of Hazel-Atlas.

(3) Also Vice-President—Operations of Hazel-Atlas.

(4) Shares registered in the name of a corporation in which Mr. Paull has a 42% interest.

It is contemplated that the present officers of Hazel-Atlas will become employees of Continental and that their initial salaries as employees of Continental will be substantially the same as their present salaries.

In the event of the consummation of the Reorganization Agreement and Plan, the firm of Goldman, Sachs & Co., 30 Pine Street, New York, N. Y., will be paid a fee by Continental for acting as agents and financial advisers of Continental in connection with the transaction. The amount of this fee is as yet undetermined. Mr. Sidney J. Weinberg, a member of the firm of Goldman, Sachs & Co., is a director of Continental.

10. PROPOSED MERGER OF CONTINENTAL WITH ROBERT GAIR COMPANY, INC.

The Board of Directors of Robert Gair Company, Inc., a Delaware corporation, and the Board of Directors of Continental have approved in principle a merger of the enterprises represented by the two companies and their subsidiaries, subject to satisfactory conclusion of investigations and studies currently in progress on various aspects of the proposed merger. Gair and its subsidiaries manufacture and sell paperboard, folding paperboard cartons, corrugated shipping containers, paper bags and other paperboard and paper products.

The details of the procedure by which the proposed merger of the two enterprises would be effected are among the matters that have not yet been settled, but agreement has been reached as to the major details of the treatment of the several classes of stock of the two companies, as follows:

(1) The holders of the existing Preferred Stock of Gair, of which 238,348 shares are now outstanding, would receive for each share held by them one share of a class of preferred stock of Continental. The Preferred Stock of Gair has a par value of $100 per share. Each share is entitled to preferred dividends at the rate of $4.50 per year and is entitled to one vote on matters submitted to stockholders generally. It is convertible until April 1, 1960 into three shares of Common Stock of Gair. It is redeemable on or after April 1, 1957 at $105 per share plus accrued unpaid dividends. It has a preference in voluntary liquidation of $105 per share and a preference in involuntary liquidation of $100 per share, in either case, plus accrued unpaid dividends. The new preferred stock of Continental to be received in exchange

would have substantially the same terms and provisions as Gair's present Preferred Stock, except that (i) the conversion rate would be 2.4 shares of Common Stock of Continental for each share of its preferred stock; and (ii) the class would be junior to the existing $3.75 Cumulative Preferred Stock of Continental. On the basis of the number of shares of Preferred Stock of Gair currently outstanding, the new preferred stock would be convertible into an aggregate of approximately 572,035 shares of Common Stock of Continental.

(2) The holders of the existing Common Stock of Gair, of which 2,981,962 shares are now outstanding, would receive for each share held by them eight-tenths of a share of Common Stock of Continental, or an aggregate of approximately 2,385,570 shares of Common Stock of Continental.

(3) The holders of the existing $3.75 Cumulative Preferred Stock and the Common Stock of Continental would retain their present securities.

Detailed studies of the various financial, organizational and legal aspects of the proposed merger are now under way and, upon their completion, the proposed transaction will be submitted to the stockholders of Continental and Gair.

For the year ended December 31, 1955, the consolidated net sales of Gair and its subsidiaries were approximately $160,240,000 and their consolidated income for the year, after provision for taxes and minority interests, was approximately $9,320,000. As at December 31, 1955, the aggregate net worth of Gair, as per its books, was approximately $75,254,000.

11. OTHER MATTERS

The enclosed proxy is solicited by and on behalf of the management of Hazel-Atlas and the cost of such solicitation will be borne by Hazel-Atlas. In addition to solicitation by mail, some of Hazel-Atlas's officers and regular employees, without extra compensation, may conduct additional solicitation by telephone, telegraph and personal interviews. In addition, Hazel-Atlas has employed Georgeson & Co., 52 Wall Street, New York, N. Y., to assist in the solicitation at an anticipated cost of approximately $6,000. Hazel-Atlas will also enlist the assistance of banks and brokerage houses in additional solicitation of proxies, particularly from their customers whose stock is not registered in the owners' names.

The management of Hazel-Atlas is not aware of any matter to come before the special meeting other than the consideration of the Reorganization Agreement and Plan and the proposed dissolution of Hazel-Atlas. However, inasmuch as matters of which the management is not now aware may come before the meeting or any adjournment thereof, the proxies confer discretionary authority with respect to acting thereon and the persons named in such proxies intend to vote, act and consent in accordance with their best judgment with respect thereto. Any proxy given pursuant to this solicitation may be revoked by the person executing it at any time before it is exercised. Upon receipt of proxies in the form enclosed and properly signed in time for voting, the shares represented thereby will be voted as indicated thereon and in this proxy statement.

By order of the Board of Directors,

N. G. Ross,
Secretary

Dated, Wheeling, West Virginia,
July 6, 1956.

Hazel-Atlas Glass Company	
Opinion of Independent Certified Public Accountants	30
Balance Sheets—December 31, 1955, and June 2, 1956	31
Statement of Income and Accumulated Earnings for the three years and twenty-two weeks ended June 2, 1956	32
Notes to financial statements	33

In the opinion of management, the financial statements of Hazel-Atlas Glass Company relating to June 2, 1956, and the twenty-two weeks then ended, include all adjustments necessary for a fair presentation of the financial position at June 2, 1956, and the results of operations for the twenty-two-week period then ended. In the preparation of the information included in the Summary of Earnings with respect to Continental Can Company, Inc. for the three months ended March 31, 1956, only normally recurring accruals, in the opinion of that Company, were considered to be necessary for a fair summarization of the results of operations for such period. Such financial statements and information have not been examined by independent certified public accountants and are not covered by the respective accountants' opinions.

Notes to Pro Forma Balance Sheet
(Unaudited)

1. The pro forma balance sheet gives effect to the following:

   (a) The acquisition on January 4, 1956 of all of the outstanding capital stock of White Cap Company in exchange for 210,000 additional shares of the Company's common stock.

   (b) The 100% stock distribution on February 15, 1956, except insofar as it affects stock sold to employees subsequent to December 31, 1955.

   (c) The acquisition of the business and assets of Hazel-Atlas Glass Company by Continental Can Company, Inc. in consideration of the issuance of 999,140 shares of common stock of Continental, the assumption by Continental of all of the liabilities of Hazel-Atlas, the merging of the Earnings Retained in the Business and the other adjustments resulting from the Reorganization Agreement and Plan, dated June 29, 1956, all as more fully described elsewhere herein.

   In the preparation of the pro forma balance sheet, the excess, namely $9,122,575, of the par value of the common stock of Continental to be issued over the par value of the capital stock of Hazel-Atlas to be retired has been charged to Capital Surplus.

2. Reference is made to notes to the financial statements of the respective companies included in this proxy statement.

CERTIFICATE OF INDEPENDENT CERTIFIED PUBLIC ACCOUNTANTS

To the Board of Directors,
Continental Can Company, Inc.,
New York, N. Y.

We have examined the financial statements listed in the index on page 14 under the caption "Continental Can Company, Inc. and Subsidiary Companies". Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying consolidated balance sheet and statements of consolidated income, capital surplus and unappropriated earnings retained in the business present fairly the consolidated financial position of the companies at December 31, 1955 and the consolidated results of their operations for the three years then ended, in conformity with generally accepted accounting principles applied on a consistent basis.

The Notes to Financial Statements on pages 26 to 29 are an integral part of these statements.

NOTE A—PRINCIPLES OF CONSOLIDATION AND GENERAL STATEMENTS

The consolidated balance sheet and statements of consolidated income, capital surplus and unappropriated earnings retained in the business include by consolidation the accounts of the Company and all significant subsidiaries.

The Company's equity in the net assets of its subsidiaries consolidated, as shown by the books of the latter as at December 31, 1955, was $13,537,622 in excess of the amount at which the investment in such subsidiaries was carried on the Company's books at that date. On consolidation, this amount has been dealt with by including $13,030,224 in unappropriated earnings retained in the business, $120,000 in retained earnings appropriated for inventory price decline or other contingencies, $567,069 in operating reserves, and $179,671 in deferred assets.

For the purpose of these accounts, fixed assets carried in Canadian currency are converted at exchange rates ruling at the dates of acquisition; other net assets in Canada are taken at the rate of exchange prevailing on December 31, 1955; profit and loss items are converted at appropriate exchange rates ruling during the period. U. S. dollars and Cuban pesos were substantially at parity during the period and for the purpose of these accounts are deemed to have been equivalent.

NOTE B—VALUATION OF INVENTORIES

Inventories are valued at the lower of cost or market. Of the total at December 31, 1955, approximately 29% in value is priced on the basis of "last-in, first-out", and approximately 71% is priced on the basis of standard, average, or actual cost. Raw materials, including materials entering into work in process and finished goods, are priced on the basis of "last-in, first-out", standard cost or average cost. Charges for labor and overhead included in work in process and finished goods are based mainly on standard cost. Machinery and parts manufactured in the companies' machine shops and included in work in process and finished goods or in supplies are charged to inventory accounts at standard cost. Supplies other than machinery and parts referred to above are priced at standard cost, average cost, or last cost.

Opening and closing inventories used in the computation of cost of sales are as follows: December 31, 1952, $80,147,126; 1953, $95,561,570; 1954, $111,369,727; and 1955, $110,715,083.

NOTE C—PROPERTY, PLANT AND EQUIPMENT

The amount at which property, plant and equipment is stated in the balance sheet does not purport to represent present-day or replacement value.

Unless otherwise indicated, properties acquired have been recorded on the books at cost or estimated cost, the latter generally being determined by appraisal.

The provisions for depreciation of physical property of the Company and its principal domestic subsidiaries other than Continental Can Corporation (operating in Cuba), have been calculated, except as to property which is being amortized over five years as permitted by related necessity certificates, on the depreciated values or unrecovered cost (actual and estimated) of the properties, the rates used being based on the estimated service lives of the various classes of property in conformity with U. S. Treasury Decision #4422. The original service lives are approximately as follows: buildings 27-50 years, building mechanicals 10-25 years, closing machine equipment 30 years, machinery and equipment 10-25 years, miscellaneous equipment 2½-20 years, furniture and fixtures 6-20 years, office mechanical appliances 8-10 years, and automobiles and trucks 3-5 years. In the case of property, plant and equipment located in Canada and Cuba the provisions for depreciation have been calculated at the following rates:

Canada (rates based on depreciated cost):	
Buildings	5% and 10%
Automobiles and trucks	30%
Machinery and equipment	20% and 50%
Cuba (rates based on cost):	
Buildings	2%
Automobiles and trucks	15%
Machinery and equipment	5%
Furniture	10%

Depletion of timberlands has been provided on a basis so computed as to amortize the cost of such timberlands by the time the estimated timber supplies will become exhausted.

The Company has elected, for Federal income tax purposes only, to depreciate fixed assets acquired after January 1, 1954 on the sum-of-the-years-digits or double declining balance methods, as permitted by the 1954 Internal Revenue Code. This has had the effect of reducing income taxes for the year 1955 by approximately $750,000 and increasing net income by a like amount. Its effect on 1954 earnings was not significant.

Maintenance and repairs are charged to income. Renewals and betterments are capitalized. With relatively minor exceptions, when fixed assets are retired or otherwise disposed of, the reserve for depreciation is charged with the actual or estimated cost thereof, less sales price, except that, in the case of the disposition of complete units of property or sales of serviceable equipment, the profit or loss is credited or charged to income.

NOTE D—PREFERRED STOCK

The $3.75 Cumulative Preferred Stock is redeemable at the option of the Board of Directors at any time, in whole or in part, at $110 per share plus an amount equal to accrued unpaid dividends.

NOTE E—COMMON STOCK

On January 4, 1956, the Company issued 219,000 additional shares of Common Stock in exchange for all of the outstanding capital stock of White Cap Company. The investment in the capital stock of White Cap Company was recorded on the books of the Company at $14,096,250, of which $4,200,000 was credited to Common Stock and $9,896,250 was credited to Capital Surplus.

On February 15, 1956, the Company distributed an additional 3,874,725 shares to the holders of its Common Stock (record date January 10, 1956) in the ratio of one additional share for each share then outstanding. At December 31, 1955, an amount of $77,494,500 was appropriated for this purpose, obtained partly from Capital Surplus and partly from Unappropriated Earnings Retained in the Business.

The Company plans to issue 999,140 additional shares of common stock in August 1956 in exchange for the net assets of Hazel-Atlas Glass Company, as more fully explained elsewhere in this proxy statement.

NOTE F—SURPLUS RESTRICTIONS

The Company's Certificate of Incorporation, the 3¼% Promissory Notes due November 1, 1995, and the various indentures relating to the Company's debentures limit the amount which may be expended for the payment of dividends and the purchase, redemption, or retirement of the Company's capital stock. At December 31, 1955, under the terms of the most restrictive of these documents, the Company could not apply more than approximately $21,400,000 to such purposes.

NOTE G—PENSION AND GROUP INSURANCE PLANS

There are presently in force two non-contributory pension plans and a supplemental contributory salaried pension plan, which became effective as of June 1, 1950. In general, the non-contributory plans provide monthly payments upon retirement at or after age 65, or upon earlier incapacity, after fifteen years service. For hourly employees the pension is based upon $2.50 per month for each year of service and is in addition to Social Security benefits. For salaried employees the amount of pension depends upon length of service and rate of compensation during the last ten years of employment, subject to allowance for certain Social Security benefits and provisions for minimum monthly pensions. The supplemental contributory salaried pension plan provides additional pensions for eligible salaried employees, computed on that part of their base earnings in excess of $4,800 per year. To participate, such employees must voluntarily contribute at the rate of 5% of their total annual earnings in excess of $4,800, the balance of the pension cost being payable by the companies. Any participating employee who attains age 65 is entitled to receive a supplemental pension, the amount of which will depend upon the number of years he has made contributions and his rate of compensation in excess of $4,800 per year during the last ten years of his membership in the plan. The companies fund their portion of the cost by contributions, sufficient each year to cover the currently accruing cost of benefit credits under the supplemental contributory salaried pension plan not covered by the contributions of participating employees.

The companies have established pension trusts to provide the pensions under each of the pension plans. The companies reserve the right to amend or discontinue the pension plans subject to certain provisions.

The following amounts were provided for the pension trusts during the three years ended December 31, 1955:

Year	United States employees' plans	Canadian employees' plans
		(Canadian dollars)
1955	$5,400,000	$444,000
1954	4,159,000	426,000
1953	3,800,000	373,112

The union-management pension agreement provides that there be paid into the pension trust for hourly-rated employees an amount of money estimated, on an actuarial basis, to be sufficient to pay the pensions which may have been granted during the term of the pension agreements. The method which the companies are presently using more than meets the requirements of the pension agreement. According to a recent actuarial estimate, assuming that the plans are continued without change, the liability for past service benefits for United States and Canadian employees, computed on the basis of a 3¼% interest rate, would amount to approximately $30,400,000. The companies have not determined the period over which such past service cost will be funded, if at all.

There is also in force a group insurance plan which includes sickness, accident, hospitalization and death benefits to all eligible officers and employees. The expense of the plan, which with minor exceptions is borne entirely by the companies, amounted to approximately $5,695,000 in 1955, $4,437,000 in 1954, and $3,787,000 in 1953, after making due allowance in each case for estimated dividends to be received in reduction of related insurance premiums.

NOTE H—EMPLOYEES' STOCK PURCHASE PLANS

An Employees' Stock Purchase Plan approved by stockholders on April 24, 1951 was in effect at December 31, 1955. This plan provides that options to purchase an aggregate of not exceeding 237,650 shares of common stock of the Company, at prices equal to 95% of the last reported sales price on the day the options are granted, may be granted from time to time to eligible executive employees; such options to be exercisable in equal annual installments during the period ending June 21, 1961. At December 31, 1955 there were unexercised options under this plan, as follows:

Date Option Granted	No. of Shares	Option Price		Fair Value at Date Option Granted	
		Per Share	Total	Per Share	Total
June 21, 1951	30,107	$35.00	$1,053,745	$36.75	$1,106,432
December 19, 1951	9,509	$42.75	$ 406,510	$45.00	$ 427,905
June 17, 1953	39,047	$48.25	$1,884,018	$50.75	$1,981,635
December 14, 1955	44,900	$77.50	$3,479,750	$81.50	$3,659,350

The following tabulation gives particulars of the number of shares with respect to which options under this plan became exercisable during the three years ended December 31, 1955:

Date Exercisable	No. of Shares	Option Price		Fair Value at Date Exercisable	
		Per Share	Total	Per Share	Total
June 21, 1955	7,016	$35.00	$245,560	$84.00	$589,344
June 21, 1955	1,455	$42.75	$ 62,201	$84.00	$122,220
June 17, 1955	5,626	$48.25	$271,455	$84.00	$472,584
June 21, 1954	9,109	$35.00	$318,815	$65.75	$598,917
June 21, 1954	1,455	$42.75	$ 62,201	$65.75	$ 95,666
June 17, 1954	5,750	$48.25	$277,438	$66.12	$380,219
June 21, 1953	13,274	$35.00	$464,590	$51.50	$683,611
June 21, 1953	1,455	$42.75	$ 62,201	$51.50	$ 74,933

During the three years ended December 31, 1955 options under this plan were exercised as follows:

	1955	1954	1953
Number of shares:			
At option price of $35.00	12,913	12,719	4,390
At option price of $42.75	1,130	3,211	250
At option price of $48.25	3,786	2,391	
Total shares	17,829	18,321	4,640
Total option price	$682,937	$697,801	$164,338
Aggregate fair value of the shares at the various dates the options were exercised	$1,377,885	$1,269,119	$245,225

Prior to December 31, 1955, all the options granted under another plan approved April 24, 1951, entitling eligible employees to purchase common stock at $33.25 per share at any time prior to December 31, 1957, were exercised. During the three years ended December 31, 1955 options under this plan were exercised as follows:

	1955	1954	1953
Number of shares	41	6,001	15,142
Total option price	$1,363	$199,533	$503,472
Aggregate fair value of the shares at the various dates the options were exercised	$3,191	$413,634	$773,938

Under a 1944 plan, which expired in 1954, 9,311 shares became exercisable during 1954 and 14,192 shares during 1953 at an option price of $35.00 per share (a total option price of $325,885 in 1954 and $496,720 in 1953). The fair value of these shares at the dates exercisable was $63.00 per share, or $586,593 in 1954 and $51.63 per share or $732,733 in 1953. Options were exercised under this plan during 1954 and 1953 as follows:

	1954	1953
Number of shares	44,149	46,278
Total option price	$1,545,215	$1,619,730
Aggregate fair value of the shares at the various dates the options were exercised	$2,680,440	$2,372,213

NOTE H—EMPLOYEES' STOCK PURCHASE PLANS (Continued)

The total of 123,563 shares (which number was adjusted in February 1956 to give effect to the stock distribution described in Note E) issuable under options outstanding at December 31, 1955 may be either authorized but unissued shares or treasury shares.

The excess of the option price of the shares issued for options exercised (other than shares issued from treasury stock) over the par value thereof ($326,900 in 1955, $984,342 in 1954, and $694,170 in 1953) has been credited to capital surplus.

NOTE I—CONTINGENT LIABILITIES

The Company is contingently liable with respect to long-term obligations receivable which, at December 31, 1955 had been sold subject to repurchase under certain conditions.

The Federal income and excess profits tax returns of the Company and its domestic subsidiaries have been examined to and including the year 1948. Income tax returns of foreign subsidiaries remain subject to future examination by taxing authorities. The accumulated reserve for taxes, included under tax accruals on the balance sheet, is estimated to be sufficient to cover additional assessments, if any.

NOTE J—COMMITMENTS

The Company holds leases covering the premises of certain of its plants. Each lease covers a period of from 5 to 25 years after December 31, 1955. The rentals under these leases aggregated approximately $1,420,000 per annum at December 31, 1955. The Company contemplates signing additional leases in 1956 providing for annual rentals of approximately $450,000.

Under an agreement with the United Steelworkers of America the Company is obligated to pay supplemental unemployment benefits commencing October 1, 1956 to eligible hourly employees who become unemployed through no fault of their own. The amount of weekly benefits to be paid by the Company will vary depending on the number of dependents, the amount of state unemployment compensation, and any other earnings which the employee receives. Under this plan the minimum amount to be paid or accrued by the Company is three cents per hour worked by covered employees; the maximum is five cents per hour worked by such employees.

NOTE K—SUPPLEMENTARY INCOME INFORMATION

(All amounts charged directly to income)

	Years Ended December 31		
	1955	1954	1953
Maintenance and repairs—			
Charged to Costs (1)	$14,089,000	$22,778,306	$18,301,805
Depreciation, depletion, and amortization:			
Costs	13,083,801	11,805,307	10,147,125
Other	1,300,202	858,082	703,941
Taxes:			
Real and personal property taxes	3,961,824	3,414,447	3,089,479
Social security taxes	3,678,590	3,514,729	2,926,165
Franchise taxes, sales taxes, etc.	844,918	403,569	563,151
Above taxes charged to:			
Costs	7,945,899	7,310,066	6,552,682
Other	539,433	22,679	26,114
Rents:			
Costs	2,010,399	2,772,899	2,291,224
Other	1,197,095	836,350	698,998
Royalties—charged to costs	134,428	92,848	102,456

(1) Compiled from the books and records of the companies without analysis of the various accounts to which these items were charged as such analysis would cause disproportionate delay and expense. Because of a change made in the classification of accounts during 1955, the cost of adjusting, oiling and cleaning of equipment is not available for that year and therefore has not been included in maintenance and repairs. In 1954, such costs in the amount of $7,662,306 were included in the total of maintenance and repairs.

[fol. 1753] OPINION OF INDEPENDENT CERTIFIED PUBLIC ACCOUNTANTS

3248

To the Stockholders of
Hazel-Atlas Glass Company

We have examined the balance sheet of Hazel-Atlas Glass Company as of December 31, 1955, and the related statement of income and accumulated earnings for the three years then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, these statements present fairly the financial position of Hazel-Atlas Glass Company at December 31, 1955, and the results of its operations for the three years then ended, in conformity with generally accepted accounting principles applied on a consistent basis during the period.

HAZEL-ATLAS GLASS COMPANY

Notes to Financial Statements

NOTE A—INVENTORIES

	Jan. 2, 1954	Jan. 1, 1955	Dec. 31, 1955	June 2, 1956 (Not Audited)
Inventories were as follows:				
Raw materials and work in process	$2,354,319	$1,981,854	$2,266,247	$2,359,565
Finished products	2,791,650	2,716,171	2,593,746	4,505,359
Maintenance materials and supplies	3,191,963	2,764,762	2,937,676	3,130,623
	$8,337,932	$7,462,787	$7,797,669	$9,995,547

Raw materials, supplies, and work in process are valued at average cost, not in excess of prevailing market. Finished products are valued in part at approximate cost, and in part at prices ascertained by deducting certain percentages from the lowest selling prices in group classifications. The foregoing basis of valuation has been consistently applied throughout the period. Cost of products sold is determined on the inventory basis, i.e., actual operating costs incurred adjusted by physical inventories valued as stated above.

NOTE B—RETIREMENT INCOME PLANS

A Retirement Income Plan for Hourly Rate Employees became effective January 1, 1955; a Retirement Income Plan for Salaried Employees, with provisions for optional contributory benefits, became effective July 1, 1955. Under both plans, eligible employees who retire from employment will receive retirement income from a trust fund established by the company for that purpose. The annual cost (before tax benefits) of both plans, based on the charge for current service and estimated past service charges funded on a 30-year amortization basis, is estimated at $830,000 under present conditions. An amount of $679,400 (also before taxes), representing a full year's requirement under one plan and a half year for the other, was paid to the Trustee and charged to income in 1955, and an amount of $350,000 has been paid to the Trustee during the 22 week period ended June 2, 1956.

NOTE C—DEPRECIATION, ETC.

Provisions for depreciation of buildings and machinery and equipment are computed by the application of annual rates to the cost of the individual units of property. The annual depreciation rates are as follows:

Land Improvements, buildings, and building equipment	3%
Tanks, simplex type lehrs, ovens, piping, etc.	6%
Machinery, individual type lehrs, heating systems, conveyors, etc.	8%
Furniture and fixtures	10%
Automatic lift trucks	12½%
Automobiles	25%

For complete new units of property acquired in 1954 and 1955, these rates have been applied by use of the sum of the years-digits method instead of the straight line method; the effect of this on the aggregate depreciation provision is insignificant.

Maintenance and repairs, and renewals are charged to operating costs as incurred. Replacements of units of physical property are charged to property accounts and the replaced units are retired.

When units of property are retired or otherwise disposed of, the cost and accrued depreciation are removed from the accounts and the net book value, less salvage, is charged or credited to income. Fully depreciated assets remain on the books until disposed of.

[fol. 1757]

	$1,358,618	$1,402,418	$1,555,415	$ 804,806
Above taxes charged to:				
Costs	$1,077,670	$1,120,773	$1,246,731	$ 661,790
Other	280,948	281,645	308,684	143,016
	$1,358,618	$1,402,418	$1,555,415	$ 804,806
Management and service contract fees	None	None	None	None

Rents and royalties paid during this period were not significant in amount and rentals or obligations under long-term leases are not material.

NOTE E—COMMITMENTS

It is estimated that expenditures of approximately $4,500,000 will be required to complete capital projects authorized but not completed as of June 2, 1956.

[fol. 1758]

EXHIBIT A

REORGANIZATION AGREEMENT AND PLAN, dated June 29, 1956, between CONTINENTAL CAN COMPANY, INC., a New York corporation (hereinafter called Continental), and HAZEL-ATLAS GLASS COMPANY, a West Virginia corporation (hereinafter called Hazel-Atlas).

I. Continental desires to acquire, and Hazel-Atlas desires to transfer to Continental, all the assets, properties, business and good will of Hazel-Atlas in exchange for the issue and delivery by Continental to Hazel-Atlas of shares of Common Stock, par value $20 per share, of Continental to be distributed to the stockholders of Hazel-Atlas in exchange for their stock in Hazel-Atlas, all upon the terms and conditions hereinafter set forth and for the purpose of carrying out a tax-free reorganization within the meaning of the Internal Revenue Code of 1954.

II. Hazel-Atlas desires to provide for the winding up and settling of its affairs in voluntary dissolution and for the distribution to its stockholders of such shares of Common Stock, par value $20 per share, of Continental as hereinafter provided, in complete liquidation and complete cancellation or redemption of its stock.

III. Hazel-Atlas hereby represents and warrants to Continental as follows:

(1) Hazel-Atlas is a corporation duly organized and existing and in good standing under the laws of the State of West Virginia, and it is entitled to own or lease its properties and to carry on its business as and in the places where such properties are now owned, leased or operated or such business is now conducted.

(2) The authorized capital stock of Hazel-Atlas consists of 3,000,000 shares of Capital Stock, par value $5 per share (hereinafter called Common Stock of Hazel-Atlas), of which 2,172,045 shares have been validly issued, are now outstanding and are full paid and non-assessable.

(3) Hazel-Atlas does not have any subsidiaries or affiliated companies of any kind.

(4) Annexed hereto as Exhibit A are balance sheets of Hazel-Atlas as of January 2, 1954, January 1, 1955 and December 31, 1955, and related statements of income and accumulated earnings of Hazel-Atlas for the three years ended December 31, 1955, certified by Messrs. Price Waterhouse & Co., independent public accountants, and an unaudited balance sheet of Hazel-Atlas as of June 2, 1956, and a related unaudited statement of income and accumulated earnings of Hazel-Atlas for the twenty-two weeks then ended. All of the above described statements are consolidated statements of Hazel-Atlas and its subsidiaries for any period during which Hazel-Atlas had subsidiaries. All such statements present fairly the financial position of Hazel-Atlas and its subsidiaries, if any, as of the respective dates of said balance sheets and the results of operations of Hazel-Atlas for the periods indicated in said statements of income and accumulated earnings, subject in the case of said unaudited balance sheet and the related unaudited statement of income and accumulated earnings to audit and usual year-end adjustments. All such statements have been prepared in conformity with generally accepted accounting principles applied on a consistent basis.

(5) At June 2, 1956 Hazel-Atlas had no liabilities, absolute or contingent, which are not shown or provided for on the unaudited balance sheet of Hazel-Atlas as of June 2, 1956 (Exhibit A annexed hereto), except as indicated in Exhibit F annexed hereto.

(6) Annexed hereto as Exhibit B is a brief description of all real properties owned by or leased to Hazel-Atlas, including all plants and structures located thereon, and, with

respect to such properties owned by Hazel-Atlas, a statement as of December 31, 1955 (or, if acquired thereafter, as of the date of acquisition thereof) of the gross book value, book reserve for depreciation and net book value thereof (subdivided into land, buildings and equipment) and the basis of valuation and the depreciation and amortization policy in respect thereof. Hazel-Atlas has good and marketable title in fee simple to such owned real properties and owns outright all the equipment in the plants referred to in said Exhibit B, except as otherwise indicated therein, and owns outright all other assets and properties reflected in the unaudited balance sheet of Hazel-Atlas as of June 2, 1956 (Exhibit A annexed hereto), or acquired by it after said date, other than such assets or properties sold or otherwise disposed of in the ordinary course of business subsequent to said date, in each case free and clear of all mortgages, liens, charges or encumbrances of any nature whatsoever, except as stated in said Exhibit B.

(7) Annexed hereto as Exhibit C is a list of all patents, patent applications and trade-mark registrations owned by or registered in the name of Hazel-Atlas or in which it has any rights. Hazel-Atlas owns, or is licensed, under such patents, trade-marks, trade names and copyrights as it deems necessary to conduct its business as now operated by it and is not currently in receipt of any notice of conflict with the asserted rights of others in such patents, trade-marks, trade names and copyrights.

(8) Annexed hereto as Exhibit D is a list and brief description of all policies of fire, liability and other forms of insurance held by Hazel-Atlas.

(9) Except as listed in Exhibit E annexed hereto, Hazel-Atlas is not a party to any written or oral (i) contract for the employment of any officer or individual employee; (ii) contract with any labor union; (iii) continuing contract for the future purchase of materials, supplies or equipment in excess of the requirements for normal operating inventories or for business now booked; (iv) continuing contract for the future sale of products over a period of more than one year from the date hereof; (v) distributor or sales agency contract or advertising contract; (vi) lease under which Hazel-Atlas is lessor; (vii) contract with any subcontractor; (viii) pension, profit-sharing, retirement or stock purchase plan in effect with respect to employees or others; or (ix) material contract not made in the ordinary course of business. Hazel-Atlas has performed all obligations required to be performed by it to date, and is not in default, under any contract, agreement, lease or other document to which it is a party.

(10) Except as indicated in Exhibit F annexed hereto, there are no actions, suits, proceedings or investigations (whether or not purportedly on behalf of Hazel-Atlas) pending or, to the knowledge of Hazel-Atlas, threatened against or affecting Hazel-Atlas, at law or in equity or admiralty or before or by any federal, state, municipal or other governmental department, commission, board, agency or instrumentality, domestic or foreign, which involve the likelihood of any judgment or liability not fully covered by insurance, in excess of $5,000 in any one case or $50,000 in the aggregate, or which may result in any material adverse change in the business, operations, properties or assets or in the condition, financial or otherwise, of Hazel-Atlas; and Hazel-Atlas is not, to the knowledge of any of its officers, in default with respect to any order, writ, injunction or decree of any court or federal, state, municipal or other governmental department, commission, board, agency or instrumentality, domestic or foreign.

(11) To the best of the knowledge, information and belief of its officers, Hazel-Atlas has complied with all laws, regulations and orders applicable to its business.

(12) The amounts set up as provisions for taxes on the unaudited balance sheet of Hazel-Atlas as of June 2, 1956 (Exhibit A annexed hereto), are sufficient for the payment of all accrued and unpaid federal, state, county and local taxes of Hazel-Atlas, whether or not disputed, for the twenty-two weeks ended on said date and for all fiscal

years prior thereto. Federal income tax returns of Hazel-Atlas have been examined by the Internal Revenue Service for all past fiscal years through the fiscal year 1952. All deficiencies proposed as a result of such examinations of the returns through the fiscal year 1952, have been paid and settled.

(13) Since June 2, 1956, Hazel-Atlas has not (i) issued any stock, bonds or other corporate securities; (ii) incurred any obligations or liability (absolute or contingent) except current liabilities incurred, and obligations under contracts entered into, in the ordinary course of business, and except obligations or liabilities entered into or incurred in connection with, or in anticipation of, the execution and performance of this Reorganization Agreement and Plan; (iii) discharged or satisfied any lien or encumbrance or paid any obligation or liability (absolute or contingent) other than obligations or liabilities referred to in (ii) above; (iv) declared or made any payment or distribution to stockholders, except a dividend of 30¢ per share payable on July 2, 1956, to holders of record of Common Stock of Hazel-Atlas on June 15, 1956, or purchased or redeemed any shares of capital stock; (v) mortgaged, pledged or subjected to lien, charge or any other encumbrance, any assets, tangible or intangible; (vi) sold or transferred any tangible assets or canceled any debts or claims, except in each case in the ordinary course of business; (vii) sold, assigned or transferred any patents, trademarks, trade names, copyrights or other intangible assets; (viii) suffered any extraordinary losses or waived any rights of substantial value; or (ix) entered into any transaction other than in the ordinary course of business, except as indicated in Exhibit E annexed hereto.

(14) At June 2, 1956, the estimated cost of completion of capital projects, which were authorized by the Board of Directors of Hazel-Atlas but not completed, was approximately $4,518,878; since that date, the Board of Directors of Hazel-Atlas has not authorized capital projects calling for the expenditure of an aggregate of more than $1,000,000.

(15) Since June 2, 1956, there has been no material change in the condition, financial or otherwise, of Hazel-Atlas as shown in the unaudited balance sheet of Hazel-Atlas as of June 2, 1956 (Exhibit A annexed hereto), other than changes occurring in the ordinary course of business, which changes have not materially adversely affected its business, properties or financial condition.

(16) The accounts receivable of Hazel-Atlas shown on the unaudited balance sheet as of June 2, 1956 (Exhibit A annexed hereto), or thereafter acquired by it prior to the date hereof, have been collected or are collectible in amounts not less than 99% of the book amounts thereof.

(17) The Board of Directors of Hazel-Atlas has duly approved this Reorganization Agreement and Plan and the transactions contemplated herein, subject to the approval thereof by the stockholders of Hazel-Atlas as required under the laws of the State of West Virginia, and has authorized the execution and delivery hereof by Hazel-Atlas.

IV. Continental represents and warrants to Hazel-Atlas as follows:

(1) Continental is a corporation duly organized and existing and in good standing under the laws of the State of New York.

(2) The authorized capital stock of Continental consists of (i) 150,000 shares of $3.75 Cumulative Preferred Stock without par value, all of which have been validly issued and are now outstanding, (ii) 145,650 shares of Second Preferred Stock without par value, none of which has been issued, and (iii) 10,000,000 shares of Common Stock of the par value of $20 per share (hereinafter called Common Stock of Continental), of which, as of May 31, 1956, 7,756,394 shares were validly issued and outstanding and

255,738 shares were reserved for issue pursuant to employees' stock purchase plans and 5,740 shares were reserved for delivery pursuant to deferred compensation agreements.

(3) Annexed hereto as Exhibit G is a consolidated balance sheet of Continental as of December 31, 1955, and statements of consolidated income and consolidated capital surplus and unappropriated earnings retained in the business for the three years then ended, certified by Messrs. Haskins & Sells, independent certified public accountants. Such statements are correct and complete and present fairly the financial condition of Continental as of December 31, 1955, and the results of operations of Continental for the three years then ended. All said financial statements have been prepared in conformity with generally accepted accounting principles.

(4) There has been no material change in the condition, financial or otherwise, of Continental as of December 31, 1955 (Exhibit G annexed hereto), except that on January 4, 1956 Continental acquired all of the issued and outstanding capital stock of the White Cap Company, a Delaware corporation, and except for changes occurring in the ordinary course of business, which changes have not materially adversely affected its business properties or financial condition.

(5) The shares of Common Stock of Continental deliverable pursuant hereto, when issued and delivered as herein provided, will be validly issued and outstanding shares of Common Stock of Continental, full paid and non-assessable except for debts, wages or salaries due and owing to laborers, servants or employees to the extent provided in Section 71 of the Stock Corporation Law of the State of New York.

(6) The Board of Directors of Continental has approved this Reorganization Agreement and Plan and the transactions contemplated herein, and has authorized the execution and delivery hereof by Continent

NOW, THEREFORE, in consideration of the premises and of the respective representations and warranties hereinabove set forth, and of the covenants and agreements herein contained, Continental and Hazel-Atlas hereby agree as follows:

ARTICLE ONE. On the terms and subject to the conditions herein set forth Hazel-Atlas hereby agrees to convey, transfer, assign and deliver to Continental, and Continental agrees to acquire and accept as hereinafter provided, all the assets, properties, business and good will of Hazel-Atlas of every kind and description, wherever located, including, without limitation, all property, tangible or intangible, real, personal or mixed, accounts receivable, bank accounts, cash and securities, claims and rights under contracts of Hazel-Atlas, rights to use the name "Hazel-Atlas Glass Company" and all other names or slogans used by Hazel-Atlas in connection with its business or products and all books and records of Hazel-Atlas relating to its business, all as the same shall exist at the time of closing referred to in ARTICLE FOUR hereof (hereinafter called the Closing Date). The assets and properties to be conveyed, transferred, assigned and delivered to Continental on the Closing Date as herein provided shall, without limitation, include all assets and property of Hazel-Atlas shown on the unaudited balance sheet of Hazel-Atlas as of June 2, 1956 (Exhibit A annexed hereto) and all assets and property thereafter acquired by Hazel-Atlas prior to the Closing Date, except such of those assets and properties of Hazel-Atlas as (i) may have been disposed of prior to the Closing Date in the ordinary course of business or in the payment and discharge of liabilities on or before the Closing Date; (ii) may have been applied prior to the Closing Date to the payment of dividends on the Common Stock of Hazel-Atlas in accordance with the provisions of ARTICLE ELEVEN hereof; and (iii) may have been otherwise disposed of prior to the Closing Date at the request or with the consent in writing of Continental.

Subject to the conditions herein set forth, from and after the Closing Date Continental shall assume and agrees to pay, perform and discharge all debts, obligations, contracts and liabilities of Hazel-Atlas of any kind, character or description whether accrued, absolute,

contingent or otherwise (and whether or not reflected or reserved against on Hazel-Atlas's balance sheets, books of account and records), all as the same shall exist at the Closing Date, and all debts, obligations and liabilities of Hazel-Atlas arising thereafter in connection with the distribution to the stockholders of Hazel-Atlas of the shares of Common Stock of Continental to be issued and delivered to Hazel-Atlas hereunder and in connection with the liquidation and dissolution of Hazel-Atlas; provided, however, that Continental shall not assume the obligation of Hazel-Atlas to distribute to its stockholders such shares of Common Stock of Continental.

The conveyance, transfer, assignment and delivery of the assets and property of Hazel-Atlas to Continental, as herein provided, shall be effected by deeds, bills of sale, endorsements, assignments, drafts, checks and other instruments of transfer and conveyance in such form as Continental shall reasonably request.

Hazel-Atlas agrees that it will, at any time and from time to time after the Closing Date, upon request of Continental, do, execute, acknowledge and deliver, or will cause to be done, executed, acknowledged and delivered all such further acts, deeds, assignments, transfers, conveyances, powers of attorney and assurances as may be required for the better assigning, transferring, granting, conveying, assuring and confirming to Continental, or to its successors and assigns, or for aiding and assisting in collecting and reducing to possession, any or all of the assets or property to be assigned to Continental as provided herein and any or all obligations of Hazel-Atlas hereunder.

ARTICLE TWO. On the terms and subject to the conditions herein set forth, Continental will issue and deliver to Hazel-Atlas on the Closing Date definitive stock certificates, in such authorized denominations and registered in the name of Hazel-Atlas or its nominee or such other names as Hazel-Atlas shall specify in writing, for an aggregate of 999,140 shares of Common Stock of Continental.

ARTICLE THREE. From and after the date hereof, Hazel-Atlas shall afford to the officers and accredited representatives of Continental free access to the properties and records of Hazel-Atlas in order that Continental may have full opportunity to make such investigation as it shall desire of the affairs of Hazel-Atlas.

ARTICLE FOUR. The closing under this Reorganization Agreement and Plan shall take place (i) at the office of Hazel-Atlas, 15th and Jacob Streets, Wheeling, West Virginia, at 11:00 o'clock A. M., Eastern Daylight Time, on the later of (a) August 8, 1956, or (b) the fifth full business day after the expiration of any waiting period which may be required by law following notification of public authorities, or (ii) at such other time and place as the parties hereto shall agree upon.

ARTICLE FIVE. To the extent that the assignment of any contract, license, lease, commitment, sales order or purchase order to be assigned to Continental as provided herein shall require the consent of the other party thereto, this Reorganization Agreement and Plan shall not constitute an agreement to assign the same if an attempted assignment would constitute a breach thereof. Hazel-Atlas agrees that it will use its best efforts to obtain the consent of the other parties to all such contracts, licenses, leases, commitments, sales orders or purchase orders of Hazel-Atlas to the assignment thereof to Continental. If such consent is not obtained, Hazel-Atlas will cooperate with Continental in any reasonable arrangement designed to provide for Continental the benefits under any such contracts, licenses, leases, commitments, sales orders or puschase orders, including enforcement, at the cost and for the benefit of Continental, of any and all rights of Hazel-Atlas against the other party thereto arising out of the breach or cancellation by such other party or otherwise.

Hazel-Atlas agrees that Continental shall have the right and authority to collect, for account of Continental, all receivables and other items which shall be transferred to Con-

tinental as provided herein, and to endorse with the name of Hazel-Atlas any checks received on account of any such receivables or other items. Hazel-Atlas agrees that it will transfer and deliver to Continental any cash or other property that Hazel-Atlas may receive in respect of such receivables or other items.

ARTICLE SIX. Hazel-Atlas will call a meeting of its stockholders to be held on August 7, 1956, for the purpose of authorizing (i) the conveyance, assignment, transfer and delivery of all the assets, properties, business and good will of Hazel-Atlas to Continental upon the terms and conditions provided herein; and (ii) upon the Closing Date the voluntary dissolution of Hazel-Atlas.

Hazel-Atlas agrees that, promptly upon receipt by it of the stock certificates for the shares of Common Stock of Continental to be received by Hazel-Atlas as provided in ARTICLE Two hereof, and in any event on or before December 31, 1956, Hazel-Atlas will distribute all such shares to its stockholders in complete winding up and liquidation of Hazel-Atlas, and that it will not otherwise dispose of any of such shares. Promptly after the Closing Date Hazel-Atlas will deliver to a bank or trust company selected by Hazel-Atlas and satisfactory to Continental the stock certificates for shares of Common Stock of Continental delivered to Hazel-Atlas as herein provided for distribution to the stockholders of Hazel-Atlas in exchange for their certificates for shares of Common Stock of Hazel-Atlas. Each share of Common Stock of Hazel-Atlas will be treated equally in such exchange. Fractional shares of Common Stock of Continental will not be issued in connection with such exchange, but, in lieu thereof, the bank or trust company referred to above, acting as the agent of each stockholder of Hazel-Atlas who would otherwise be entitled to a certificate for a fractional share of Common Stock of Continental in such exchange, will sell such stockholder's fractional interest and remit to him the net proceeds of such sale.

From and after the Closing Date, Hazel-Atlas will not engage in any business or other activity except as required to complete the liquidation and dissolution of Hazel-Atlas as provided herein.

ARTICLE SEVEN. The obligations of Continental hereunder are subject to the conditions that, on or before the Closing Date:

(1) At the meeting of the stockholders of Hazel-Atlas provided for in ARTICLE SIX hereof, the holders of at least sixty per cent of the outstanding shares of Hazel-Atlas entitled to vote thereat shall have voted in favor of the matters specified in clauses (i) and (ii) of said ARTICLE SIX.

(2) All actions, proceedings, instruments and documents required to carry out this Reorganization Agreement and Plan, or incidental thereto, and all other related legal matters, shall have been approved by Messrs. Willkie Owen Farr Gallagher & Walton, counsel for Continental.

(3) Continental shall have received an opinion of Messrs. Paul & Phillips, counsel for Hazel-Atlas, dated the Closing Date, in form and substance satisfactory to Continental, to the effect that (i) Hazel-Atlas is a corporation duly organized and existing and in good standing under the laws of the State of West Virginia and is entitled to own or lease its properties and to carry on its business as and in the places where such properties are now owned, leased or operated or such business is now conducted; (ii) Hazel-Atlas is not a party to any material pending litigation, and such counsel know of no material threatened litigation against Hazel-Atlas, except as indicated in Exhibit F annexed hereto, (iii) Hazel-Atlas has full power and authority to convey, assign, transfer and deliver its assets, properties, business and good will to Continental as herein provided; (iv) all corporate and other proceedings required to be taken by or on the part of Hazel-Atlas to authorize it to carry out this Reorganization Agreement and Plan and so to convey, assign, transfer

[fol. 1763a]

and deliver its assets, properties, business and good will have been duly and properl, taken; and (v) the vote of the stockholders of Hazel-Atlas taken at the meeting provided for in ARTICLE SIX hereof operates (except for directors' action), so far as Hazel-Atlas is concerned, to authorize the conveyance, transfer, assignment and delivery of all the assets, properties, business and good will of Hazel-Atlas to Continental in exchange for shares of Common Stock of Continental upon the terms and conditions provided herein and to bind all stockholders of Hazel-Atlas thereto.

(4) Continental shall have received an opinion of Messrs. Fish, Richardson and Neave, patent counsel for Hazel-Atlas, dated the Closing Date, in form and substance satisfactory to Continental, (i) as to the status of, and title of Hazel-Atlas to, the patents, patent applications and trade-mark registrations owned by or registered in the name of Hazel-Atlas or in which it has any rights and listed in Exhibit C annexed hereto, and (ii) stating the general effect of the judgment dated October 31, 1945 imposed by the District Court of the United States for the Northern District of Ohio, Western Division, in the Civil Action No. 4426, entitled *United States of America* v. *Hartford Empire Company, et al.* in which the original complaint was filed December 11, 1939, on the use of such patents, patent applications, trade-mark registrations and rights.

(5) Hazel-Atlas shall have furnished to Continental legal opinions or other evidence, in form and substance satisfactory to Continental, covering the good and marketable title in fee simple of Hazel-Atlas in and to its real properties, free and clear of all mortgages, liens, charges or encumbrances of any nature whatsoever, except as stated in Exhibit B annexed hereto, and the due authorization, execution and delivery, legal effectiveness in accordance with their respective terms, and sufficiency for purposes of recordation or filing, of the instruments of conveyance, transfer and assignment from Hazel-Atlas to Continental of the assets, properties, business and good will of Hazel-Atlas.

(6) Continental shall have received an opinion of Messrs. Price Waterhouse & Co., dated the Closing Date, in form and substance satisfactory to Continental, to the effect that in their opinion the reserves set up on the books of Hazel-Atlas for taxes for the years 1953, 1954 and 1955 are adequate to cover all tax adjustments which may have to be made for said years.

(7) Continental shall not have discovered any material error, misstatement or omission in the representations and warranties made by Hazel-Atlas in Recital III hereof, and all the terms and conditions of this Reorganization Agreement and Plan to be complied with and performed by Hazel-Atlas on or before the Closing Date shall have been complied with and performed.

(8) The business and properties of Hazel-Atlas shall not have been adversely affected in any material way as a result of any fire, accident or other casualty or act of God or the public enemy.

(9) The representations and warranties made by Hazel-Atlas herein shall be correct, on and as of the Closing Date, with the same force and effect (except as affected by the transactions contemplated herein and changes occurring in the ordinary course of business) as though such representations and warranties had been made on and as of the Closing Date, and Hazel-Atlas shall have delivered to Continental a certificate to such effect and also as to the compliance by Hazel-Atlas, as of the Closing Date, with the terms and conditions hereof, such certificate to be signed by a duly authorized officer of Hazel-Atlas under its corporate seal and to be in form satisfactory to Continental.

(10) An investigation to be made by Continental shall show that there have been no developments in Hazel-Atlas business since June 2, 1956, which would have a materially adverse effect on the value of its business.

ARTICLE EIGHT. The obligations of Hazel-Atlas hereunder are subject to the conditions that, on or before the Closing Date:

(1) All actions, proceedings, instruments and documents required to carry out this Reorganization Agreement and Plan, or incidental thereto, shall have been approved by Messrs. Paul & Phillips, counsel for Hazel-Atlas.

(2) Hazel-Atlas shall have received an opinion of Messrs. Willkie Owen Farr Gallagher & Walton, counsel for Continental, dated the Closing Date, in form and substance satisfactory to Hazel-Atlas, to the effect that (i) Continental is a corporation duly organized and existing and in good standing under the laws of the State of New York; (ii) all corporate and other proceedings required to be taken by or on the part of Continental to authorize it to carry out this Reorganization Agreement and Plan and to issue and deliver the shares of Common Stock of Continental deliverable pursuant hereto as provided herein have been duly and properly taken; and (iii) said shares of Common Stock of Continental will, on delivery thereof to Hazel-Atlas in accordance with the terms hereof, be duly and validly issued, full paid and non-assessable, except for debts, wages or salaries due and owing to laborers, servants or employees to the extent provided in Section 71 of the Stock Corporation Law of the State of New York.

(3) Hazel-Atlas shall not have discovered any material error, misstatement or omission in the representations and warranties made by Continental in Recital IV hereof, and all the terms and conditions of this Reorganization Agreement and Plan to be complied with and performed by Continental on or before the Closing Date shall have been complied with and performed.

(4) The business and properties of Continental shall not have been adversely affected in any material way as a result of any fire, accident or other casualty or act of God or the public enemy.

(5) An investigation to be made by Hazel-Atlas shall show that there have been no developments in Continental's business since December 31, 1955, which would have a materially adverse effect on the value of its business.

ARTICLE NINE. Continental and Hazel-Atlas agree that the representations and warranties contained in Recitals III and IV hereof shall expire with, and be terminated and extinguished by, the closing under this Reorganization Agreement and Plan on the Closing Date, such closing to be conclusive evidence that each party is fully satisfied with the facts constituting the basis of the representations and warranties of the other party.

ARTICLE TEN. The respective obligations of Continental and Hazel-Atlas hereunder are subject to the further condition that, on the Closing Date, Continental and Hazel-Atlas shall have received an opinion of Messrs. Willkie Owen Farr Gallagher & Walton, counsel for Continental, dated the Closing Date, to the effect that (1) registration under the Securities Act of 1933 of the shares of Common Stock of Continental deliverable pursuant hereto is not required and (2) said shares of Common Stock of Continental have been duly listed, subject to official notice of issuance, on the New York Stock Exchange and on any other exchange on which the Common Stock of Continental is then listed.

ARTICLE ELEVEN. Between the date hereof and the Closing Date Continental shall not authorize or make any split-up of its capital stock, and neither Continental nor Hazel-Atlas shall declare or pay any dividends on their respective Common Stocks except (i) a dividend to holders of Common Stock of Hazel-Atlas of not exceeding 30¢ per share payable on July 2, 1956, (ii) a dividend to holders of Common Stock of Continental of not exceeding 45¢ per share to be payable in September, 1956, and (iii) such other dividends to holders of Common Stock of Continental as may be declared provided that if any such other dividend is declared,

or if said September, 1956 dividend of Continental shall not be declared with respect to the shares of Common Stock of Continental to be delivered to Hazel-Atlas hereunder, Hazel-Atlas shall have a corresponding right to declare dividends to holders of its Common Stock in an amount per share equivalent to 46/100 of the amounts per share declared by Continental.

ARTICLE TWELVE. If the transactions contemplated hereby shall not be consummated, each party hereto shall pay its own expenses incident to preparation for carrying this Reorganization Agreement and Plan into effect and consummating said transactions.

ARTICLE THIRTEEN. Continental hereby waives compliance by Hazel-Atlas with the provisions of any applicable Bulk Sales Law.

ARTICLE FOURTEEN. This Reorganization Agreement and Plan shall not be assignable by either party, except with the written consent of the other. Nothing in this Reorganization Agreement and Plan, expressed or implied, is intended to confer upon any person, other than the parties hereto and their successors and assigns, any rights or remedies under or by reason of this Reorganization Agreement and Plan.

ARTICLE FIFTEEN. The parties hereto may by written agreement (a) change the time for performance of any of the obligations or acts of the parties hereto, including changes of the Closing Date, (b) waive any inaccuracies in the representations contained in this Reorganization Agreement and Plan or in any documents delivered pursuant hereto, and (c) waive compliance with or modify any of the covenants herein contained and waive or modify performance of any of the obligations of the parties hereto; provided, however, that no modification shall be made in the number of shares of Common Stock of Continental to be delivered hereunder.

ARTICLE SIXTEEN. Any notice, request, instruction or other document to be given hereunder by either party hereto to the other shall be in writing and delivered personally or sent by registered mail, postage prepaid, if to Continental, addressed to Continental, attention of its Secretary and Treasurer, at 100 East 42nd Street, New York 17, N. Y., and if to Hazel-Atlas, addressed to Hazel-Atlas, attention of its Executive Vice President, at 15th and Jacob Streets, Wheeling, West Virginia.

ARTICLE SEVENTEEN. This instrument contains the entire agreement between the parties hereto with respect to the transactions contemplated herein.

IN WITNESS WHEREOF, Continental Can Company, Inc., and Hazel-Atlas Glass Company have caused this Reorganization Agreement and Plan to be executed in their respective corporate names by their respective officers thereunto duly authorized and their respective corporate seals to be hereunto affixed and duly attested as of the day and year first above written.

MANAGEMENT'S REVIEW . . . . . and the OUTLOOK

The year 1955 was an exceptional year in the history of the Continental Can Company, as it was our fiftieth anniversary and fittingly was also our most successful year.

SALES AND EARNINGS – Our sales of $666.3 million represented an 8 per cent increase from the preceding year, and our earnings on these sales of $48.3 million before and $24.2 million after income taxes were the highest in our history, exceeding the earnings of the preceding year by 18 per cent and 16 per cent, respectively. Earnings per Common share amounted to $6.44 on 3,564,403 shares as compared with $5.52 in 1954 on 3,546,533 shares. Our principal sales gains came from increased sales of metal cans for beer, fruits, dairy products, coffee, oil, pet food, paint and liquid detergents, paperboard, paper containers; crown caps; and flexible packaging.

OPERATIONS – Our manufacturing operations were conducted throughout the year at the highest rate of manufacturing efficiency yet attained – another record year for your Company.

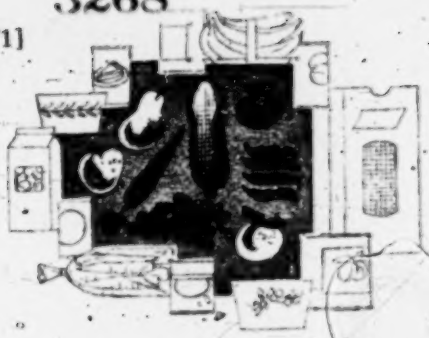
CAPITAL IMPROVEMENTS – During the year our expenditures for capital improvements amounted to $28.4 million. In addition, a new fibre drum plant at Midland, Michigan, and a new research and equipment development building at Chicago for the Metal Division were built under lease-back arrangements with pension trusts.

As we look ahead, we foresee a continuing need for capital improvements of approximately $30 million a year to maintain our position in the packaging industry and to enable us to properly service our customers.

We are engaged now in installing a semi-chemical pulp operation in our Hopewell, Virginia, paper mill, which will permit us to use hardwoods available in the area. This year the Hopewell paper plant proved to be a substantial earner for the Company, as our previous capital expenditures gave us maximum utilization for the first time. In addition to the semi-chemical pulp operation at Hopewell, we expect to build a new can plant in Cincinnati, Ohio, and at least two other can plants in locations not yet determined. We will also build a new paper container plant during the year.

During 1955 the Company purchased the patents and production facilities of Vaporized Metal Coatings, Inc., of Roosevelt, New Jersey, whose process for the high-speed coating of metal on materials such as cellophane, pliofilm, etc., offers promise. Our present limited output has resulted in orders beyond our ability to produce and new machines are being built to increase output.

A major acquisition of your Company, agreed to in October, 1955 and which became effective on January 4, 1956, was the exchange of 210,000 shares of our Common stock for the capital stock of the White Cap Company. We are impressed with the management of this company, which has been highly successful in the manufacture and sale of metal closures, principally for glass jars, and we propose to continue its operation under its existing management as a separate subsidiary. It should add over $25



million to our sales volume for 1956. It further diversifies our packaging operations while its manufacturing processes and procedures are closely allied to those in which we are now engaged.

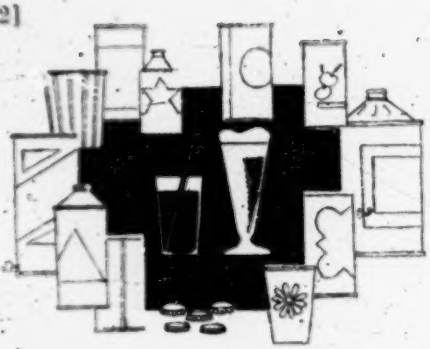
FINANCING – In view of the continuing demand for funds for capital improvements, during the year we undertook a refinancing of previous bond issues together with the raising of $25 million of new capital. To do this, we sold $25 million 3¼ per cent forty-year notes of the Company to the Metropolitan and New York Life insurance companies and exchanged $39.5 million of our 3 per cent and 3⅛ per cent Sinking Fund Debentures maturing on December 1, 1965, for forty-year debentures due November 1, 1995, bearing interest of 3¼ per cent to November 1, 1965, and 3¾ per cent thereafter. This will decrease our annual amortization charges for the immediate future while supplying us with the additional capital which we need for the next several years.

EMPLOYEE RELATIONS – During the year we signed a new master agreement with the United Steelworkers of America (C.I.O.) which became effective October 1, 1955, and runs until September 30, 1957, except for a wage re-opening provision on October 1, 1956. Under this agreement the principal adjustments included a general wage increase, improved pension provisions under an agreement which lasts for five years, and a supplemental unemployment benefits plan to be effective over the next three years. These adjustments represented an increase equivalent to about 9% of the straight-time average hourly rate. This master contract covers approximately half of our hourly employees. Other labor contracts were also renewed satisfactorily.

If we are to be competitive with other products, continuous effort must be made to increase productivity, improve quality and lower costs. We believe that union leadership has recognized its own interest in these factors and will cooperate with your Management to obtain these objectives. Mr. David J. McDonald, President of the United Steelworkers of America, joined your chairman in joint meetings in several parts of the country attended by both plant managers and their staffs and by local union presidents and other union officials. During these meetings our common objectives were discussed freely and frankly and it is our hope and belief that better understanding has resulted.

RESEARCH AND ENGINEERING – One of the principal reasons for our progress during the last five years has been the improved research and engineering made possible by the expenditures of $36.7 million for the purpose as compared with $15.3 million in the previous five-year period. During the year we started the move of the metal can research and engineering activities into our new research and development building in Chicago, where for the first time they will have adequate facilities consolidated in a single building. In addition, a competent Company research and development group has been assembled to assist the several divisions of the Company in their research and development work and to explore new fields.

Emphasis is being placed on the design and development of new packages and the possible use of new materials becoming available in the market. Packaging in this country is becoming of increasing importance, particularly as the part it plays in selling products is being recognized more and more. Our diversification and our position in the packaging field depend on the effectiveness of our research and development programs, and these programs are receiving the personal attention of Management. Recognizing the potential value of the broad new field of nuclear science, your Company has joined



with other companies in a joint venture to establish a research nuclear reactor which will enable us to increase our studies in the possible application of atomic energy to our products.

MANAGEMENT – Two of our senior officers, Hans A. Eggerss, President, and Sherlock McKewen, Vice President, Pacific Metal Division, retired on December 31, 1955, under the Company's retirement plan. They have given the Company many years of valued and loyal service and have contributed substantially to its success. As a result of these retirements, Thomas C. Fogarty, formerly Executive Vice President, Metal Division, has become President. Reuben L. Perin, formerly Vice President, Metal Division, Eastern, has become Executive Vice President, Metal Division, and has been succeeded by Orren R. McJunkins, former General Manager of the Southeastern District, Metal Division. Mr. McKewen has been succeeded by Horace M. Blinn, former General Manager of the California District, Metal Division. Your Management considers one of its major tasks to be the development of personnel for high executive positions in your Company. It is satisfied that these new officers have outstanding qualifications to fill the positions to which they have been promoted and that your Company can be proud of this management team.

While the White Cap Company is to be continued as a separate subsidiary under its own officers, Philip O'C. White, its president, has also been elected a Vice President of Continental Can Company.

OUTLOOK – We believe that the general business outlook for 1956 continues satisfactory and that it provides a favorable climate for the further growth of the packaging industry. Our diversified position in this industry, the trend toward individual packages as an aid to selling and to consumer convenience, and the rapid growth of population combine to make the immediate future most encouraging. Canned fruit and vegetable inventories are in excellent shape and large packs are anticipated in 1956. The use of metal cans for established products continues to grow, and can markets such as soft drinks, liquid detergents, and cosmetics in aerosol cans offer additional possibilities. Likewise, we see a continuing growth in paper containers, flexible packaging and other product lines.

We have confidence that present administration of Government will continue to encourage sound economic projects. Thus we look for 1956 to be another year of growth for your Company and we are optimistic with respect to the year ahead. We have an efficient and enthusiastic organization which we believe capable of meeting the problems certain to arise, with enthusiasm and determination. We commend this organization to you.

By order of the Board of Directors

T. C. Fogarty

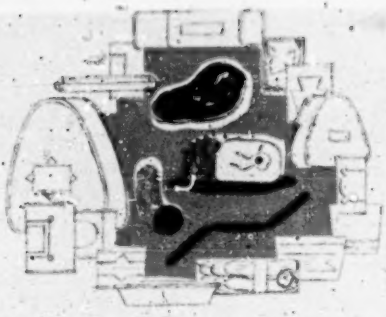
President

Lucius Clay

Chairman of the Board

March 9, 1956

[fol. 1773]



1955 IN BRIEF

What we received and what we did with it

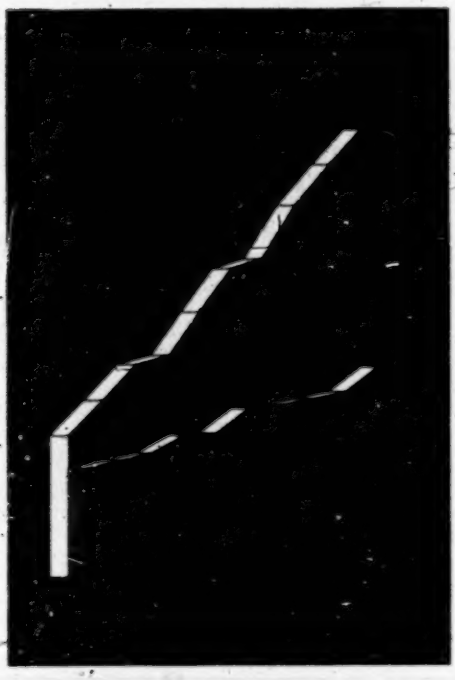
* Decrease.

FINANCIAL AND OPERATING REVIEW

SALES – Again net sales have established a new high record totaling $666,266,408 compared with $616,163,898 in 1954 – an increase of $50,102,510 or 8.1%. Physical volume was up about 7%.

EARNINGS – After income taxes and other charges, net earnings amounted to $24,172,218 or 3.6% on sales. This compared with $20,736,899 or 3.4% on sales in 1954. After Preferred dividends, earnings were equivalent to $6.44 per share on 3,664,403 shares of Common stock, as against $5.52 on 3,646,533 shares in 1954.

Earnings before income taxes in 1955 amounted to $48,272,218 or 7.2% on sales compared with $40,936,899 or 6.6% on sales in 1954.

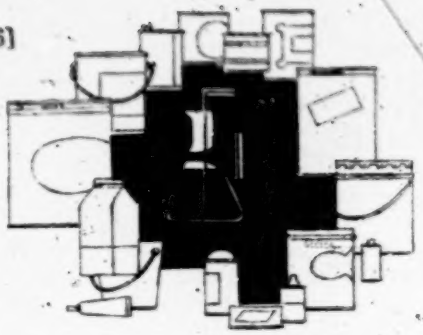


The over-all improvement in earnings over 1954 is particularly significant in that it was achieved despite a decline of $2,310,384 in non-operating net income. Reduced profits on sales of capital assets including sales of equipment formerly leased to customers, and higher interest charges were the principal items resulting in the lower non-operating net income.

Income from foreign operations and investments in other countries, except Canada and Cuba, is reflected only as received in dollars in the United States. At the present time, accumulated dividends and interest funds arising in Argentina prior to June 30, 1955, are blocked. All other funds are unrestricted.

Provision for taxes on income amounted to $24,100,000. This compares with $20,200,000 provided in 1954. All other taxes, exclusive of those on purchases and for social security, were $4,806,550 as against $4,012,815 in 1954.

Salaries and wages increased to $146,803,770 from a total of $144,538,467 in 1954. Employee benefits – including social security taxes, insurance benefits, rest periods and pension fund contributions – amounted to $32,236,112 as compared with $28,581,724 in 1954. The combined compensation and benefits averaged $5,562 per employee, compared with $5,263 per employee in 1954.



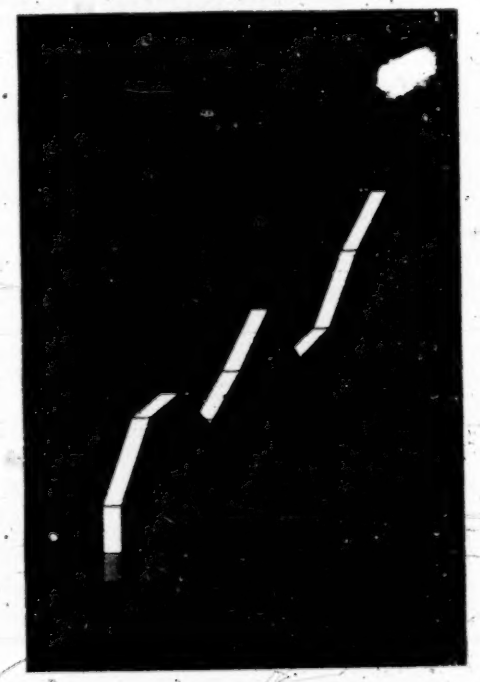
Depreciation and depletion provided out of operating income amounted to $13,606,857 in 1955, against $11,971,425 in 1954. Accelerated depreciation under approved Necessity Certificates included in these totals, amounted to $1,306,291 in 1955 and $1,148,460 in 1954. For tax purposes, but not for book purposes, capital expenditures since January 1, 1954, have been depreciated on "the sum of the years-digits" or "declining balance" methods. This has had the effect of reducing income taxes for the year 1955 by approximately $750,000.

DIVIDENDS – After dividends of $11,534,165 there remained net earnings of $12,638,053 or 52.3%, which were reinvested in the business. In addition to regular dividends on the $3.75 Cumulative Preferred stock, regular quarterly dividends of 75¢ per share were paid on the Common stock on March 15, June 15, September 15 and December 15. The annual dividend rate of $3.00 per share compares with a total of $2.70 per share paid in 1954. At the meeting of the Board of Directors on December 21, 1955, a 100% stock distribution was declared payable February 15, 1956, to holders of record on January 10, 1956. At the regular dividend meeting of the Board in January, 1956, a quarterly dividend of 45¢ per share on the new shares was established. This is equivalent to an annual rate on the old shares of $3.60 per share as compared with the $3.00 paid in 1955.

WORKING CAPITAL – The ratio of current assets to current liabilities on December 31, 1955, was 2.6 to 1, which compares with a ratio of 2 to 1 at December 31, 1954. Current assets totaled $178,579,352 and current liabilities totaled $67,763,536. Working capital increased during the year from $82,330,380 to $110,815,816. This resulted largely from the borrowing of $25,000,000 on 40 year, 3¾% notes on November 10, 1955.

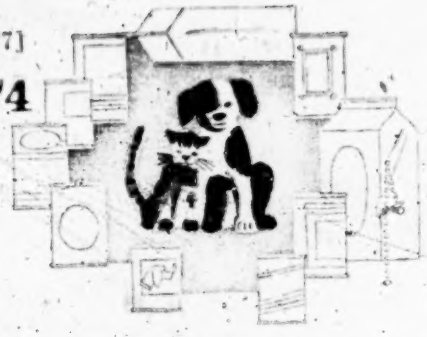
Inventories are valued at the lower of cost or market. Cost, for this purpose, represents standard, average, or actual cost with respect to 71% of the 1955 inventories (70% in 1954) and "Last in – first out" (LIFO) cost as to the remaining 29% (30% in 1954). This latter method was initially applied in 1946 to the stock of raw paper of one of the Company's subsidiaries and to the Company's tin-plate in 1947.

Federal income and excess profits tax returns of the Company and its domestic subsidiaries have been examined by the Internal Revenue Service through 1948. The tax accruals of $24,373,991 at December 31, 1955 are considered adequate to cover any assessments which may result from examination of returns for other years.



[fol. 1777]

3274



INVESTMENTS – Investments In and Advances To Associated Companies and Subsidiaries Not Consolidated, amounting to $7,481,198 at December 31, 1955, are recorded at cost. Included in this amount is $3,404,314 representing investments in securities regularly quoted on stock exchanges, the market quotation value of which, at December 31, 1955, was approximately $10,440,000.

FIXED ASSETS – Property, Plant and Equipment, at cost, amounted to $277,176,778 at December 31, 1955, compared with $259,427,581 at the end of 1954, reflecting an increase of $17,749,197 for the year. After Reserves for Depreciation and Depletion, the net book value of these Fixed Assets was $189,012,392 on December 31, 1955, and $181,170,956 on December 31, 1954.

Gross capital expenditures during 1955 totaled $24,444,550. This included completion of the metal can installations at Omaha and additional can lines and lithograph equipment, which were installed at various plants in the United States and Canada for the manufacture of containers for beer, other beverages, shortening, soluble coffee, meats and detergents. It also included single-wrap paper cup lines added at Los Angeles; equipment for rounding out of paper product lines at Kensington, Connecticut, Three Rivers, Michigan and Chicago, Illinois; the equipment for the new fibre drum plant at Midland, Michigan; and the purchase of timberlands to augment the Company's supply of pulp wood for its Hopewell, Virginia, paper mill.

Necessity Certificates, which allow for accelerated tax write-offs covering a value of $15,091,790, have been issued to the Company over the past five years. These permit write-offs, varying from 25% to 65% of the new investment, over a five-year period.

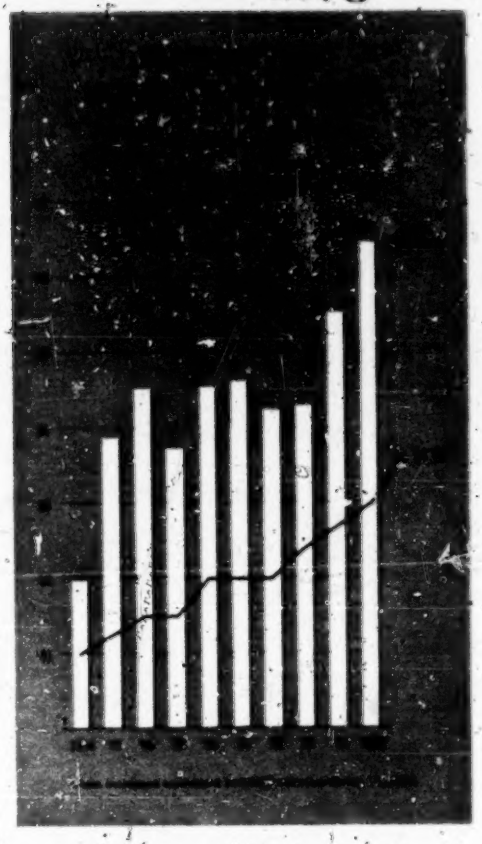
EMPLOYEES AND EMPLOYEE BENEFITS – During 1955 an average of 32,187 men and women were employed by the Company, compared with 32,892 in 1954. More than half of our employees have been with the Company over 5 years. About one-fourth are women.

Employees, and to some extent their dependents, are covered by a comprehensive non-contributory group insurance plan. The net cost to the Company of this group insurance for the policy year ending June 30, 1955, was $5,066,380, increasing from $3,669,081 for the previous policy year. At December 31, 1955, a total of $258,316,325 of life insurance was in force for 31,689 employees (including $5,274,725 for 817 retired employees), compared with a total of $236,372,100 at the end of 1954. During the latest policy year, total claims paid by the insurance company to

[fol. 1778]



employees and dependents amounted to $4,644,909, of which $1,247,500 was for death claims.

As of December 31, 1955, there were 490 employees retired and receiving monthly pensions under the Company's retirement plans. This represented a net increase of 131 persons during the year. During 1955 the Company provided $5,400,000 for the pension fund for U. S. employees and $444,000 (Canadian) for Canadian employees. Comparable 1954 figures were $4,159,000 and $426,000 (Canadian), respectively.

The Non-Contributory Pension Plans were revised in the negotiations with the United Steelworkers of America last fall. Under the new provisions, effective for the most part January 1, 1956, minimum pensions were substantially increased for eligible employees, those with 15 years of service or more. The pension is now based on $2.50 per month for each year of service and is an addition to Social Security benefits. Disability pensions will be determined at the rate of $3 per month for each year of service with a minimum of $90 per month.

According to a recent actuarial estimate, which gives effect to improved pensions as referred to above, the liability for past service benefits under the plans, assuming they are continued without change, would amount to approximately $30,400,000. The Company has not determined the period over which such past service cost will be funded, if at all.

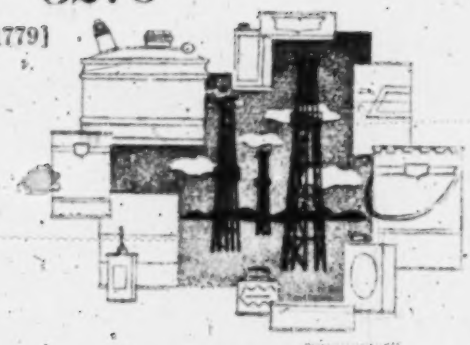
During the last quarter, initial accruals were made for the cost of the Supplemental Unemployment Benefits Plan which was also the result of negotiations last fall with the United Steelworkers of America. This plan provides limited income protection after October 1, 1956 for eligible hourly employees who become unemployed through no fault of their own. To be eligible an employee must have had 2 years of continuous service with the Company, not less than 4,500 total hours of work, and a minimum of 3,000 hours during the 36 months preceding any layoff. The amount of weekly benefits to be paid by the Company will vary depending on the amount of state unemployment compensation and any other earnings which the employee receives. Under this plan the maximum income for an employee with two dependents is $55.00 per week, including the items mentioned above. These weekly benefits may be paid to an employee having maximum eligibility for as long as 52 weeks.

During the year, a total of 17,870 shares of the authorized but unissued Common stock was sold to 69 employees under the various Employees' Stock Purchase Plans previously approved by the shareholders.

At December 31, 1955, 96 key employees held options to purchase a total of 123,563 shares (247,126 shares after 100% stock distribution of February 15, 1956) of Common stock under the existing plan. Of this total, 30,107 shares were granted in June, 1951, at a price of $35.00 per share, 9,509 shares in December, 1951, at a price of $42.75 per share, 39,047 shares in June, 1953, at a price of $48.25 per share, and 44,900 shares in December, 1955, at a price of $77.50 per share. All of these options are exercisable in equal annual installments from the date granted and expire on

3276

[fol. 1779]



June 21, 1961. The price of the shares in each case is approximately 95% of the market price on the date the option was granted.

OUR SHAREHOLDERS – On December 31, 1955, there were 1,260 holders of the outstanding 150,000 shares of $3.75 Cumulative Preferred stock and 27,981 holders of the outstanding 3,664,403 shares of Common stock, of which 29 shares are represented by fractional scrip certificates.

On November 25, 1955, the record date of the last 1955 Common dividend, the Common shares were distributed as follows:

Shares Held By:	Number of Holders	%	Shares Held	%	Average No. Shares Per Holder
Men	10,202	36.5	715,054	19.5	70
Women	11,620	41.6	650,026	17.7	56
Joint Tenants	2,428	8.7	85,412	2.3	35
Fiduciaries	2,275	8.1	223,917	6.1	98
Brokers	211	.8	239,380	6.6	1,135
Nominees	471	1.7	1,319,134	36.0	2,801
Institutions and Foundations	259	.9	108,886	3.0	420
Corporations, Insurance Companies, Investment Trusts, etc.	475	1.7	322,559	8.8	679
TOTAL	27,941	100.0	3,664,368	100.0	

Of the total number of shareholders shown in the table above, 263 holding 39,356 shares were located in foreign countries; 7,363 or 26% held 10 shares or less, and 3,593 or 13% owned over 100 shares each.

PACKAGING – and its Expanding Markets

From the day a baby is born, he is a new and important customer for the packaging industry. Milk, formula, medicinals, powders, oils, clothing – literally dozens of new packaged products are essential to satisfy his manifold needs. And from infancy to old age, he continues to use packaged products, many times a day, *every day of his life*.

Of special interest, then, is our increasing population – from 151 million in 1950 to an estimated 165 million in 1955 and an anticipated 190 million in 1965. Men now live 18 years longer than they did in 1910, and women, about 20 years. The population factor alone provides an ever-expanding base for the packaging industry. This is added to daily by the new demands for packaging service.

Another characteristic of the packaging industry is that it serves the consumers in all economic levels. A low-income family may buy cheaper foods, but they will buy almost as much and, regardless of price, these foods are usually packaged. This is true not only of foods but also of cosmetics, tobacco, coffee, and hundreds of other commodities.

Our American way of life, hence, is a packaged way of life. As a matter of taste, convenience and necessity, we demand packaging if it is at all possible. And our economic system of mass production and mass distribution depends very largely upon packaging to protect, to help sell, to provide more satisfaction in the goods contained.

When we consider our high American standard of living, we usually think in terms of *goods*. Perhaps we should first think of *packaging*. For more often than not it is the science of packaging that has turned luxuries into commonplace necessities, and thus has provided for year-round abundance. In every field, new products, and old products in quest of a competitive advantage, turn to packaging for better consumer acceptance.

Continental stands broadly astride this ever-expanding market. Some 15 years ago, your Company was literally a "can" company. Today, Continental's position in the growing metal container industry is stronger than ever before. But paralleling this growth of the Metal Division has been a lateral expansion into new packaging fields. In flexible packaging; paper plates, paper cups and containers; fibre shipping drums; bottle caps and jar closures; plastic squeeze bottles and tubes – and in scores of subdivisions of these product groupings – the Company is probing new markets, finding new opportunities for growth and expansion and constantly increasing its production facilities to keep pace with the increasing demands.

Peter F. Wojtul

Vice President – Sales

Notes to FINANCIAL STATEMENTS

A

At December 31, 1955, the Company also had authorized but not issued 145,650 shares of Second Preferred stock (without par value).

B

On January 4, 1956, the Company issued 210,000 additional shares of Common stock in exchange for all of the outstanding capital stock of White Cap Company. The investment in the capital stock of White Cap Company was recorded on the books of the Company at $14,096,250, of which $4,200,000 was credited to Common stock and $9,896,250 was credited to Capital Surplus.

On February 15, 1956, the Company distributed an additional 3,874,725 shares to the holders of its Common stock (record date January 10, 1956) in the ratio of one additional share for each share then outstanding. At December 31, 1955, an amount of $77,494,500 was appropriated for this purpose, obtained partly from Capital Surplus and partly from Unappropriated Earnings Retained in the Business.

C

Capital Surplus decreased during the year by $30,922,647, reflecting a $326,900 excess of consideration received over the par value of Common stock sold under the Employees' Stock Purchase Plans and an appropriation of $31,249,547 for the Common stock distribution on February 15, 1956.

D

The Company's Certificate of Incorporation, the 3¾% Promissory Notes due November 1, 1995, and the various indentures relating to the Company's debentures limit the amount which may be expended for the payment of cash dividends and the purchase, redemption, or retirement of the Company's capital stock. At December 31, 1955, under the terms of the most restrictive of these documents, the Company could not apply more than approximately $21,400,000 to such purposes.

HASKINS & SELLS
CERTIFIED PUBLIC ACCOUNTANTS

AUDITORS' REPORT

[illegible] BROAD STREET
NEW YORK 4

February [illegible], 1956.

To The Board of Directors and Shareholders,
Continental Can Company, Inc.:

We have examined the consolidated balance sheet of Continental Can Company, Inc. and its subsidiary companies consolidated as of December 31, 1955 and the related consolidated statements of income and unappropriated earnings retained in the business for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying consolidated balance sheet and consolidated statements of income and unappropriated earnings retained in the business present fairly the consolidated financial position of the companies at December 31, 1955 and the consolidated results of their operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

THE BOARD OF DIRECTORS

Stephen D. Bechtel
President of Bechtel Corporation, San Francisco, Calif., engineers and constructors

Paul C. Cabot
President of State Street Investment Corporation, Boston, Mass.

Arthur G. Chase
Chairman of the Board of Precision Castings Company, Inc., Fayetteville, N. Y., manufacturers of die castings

Lucius D. Clay
Chairman of the Board of Directors of the Company

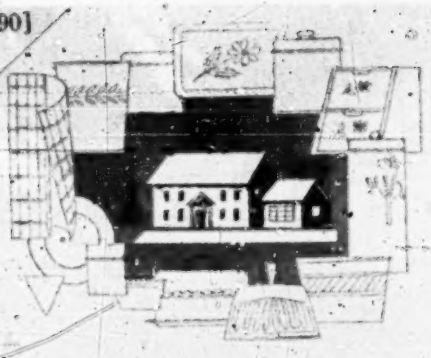
Carle C. Conway
Chairman of the Executive Committee and Consultant to the Company

George P. Edmonds
President of Wilmington Trust Company, Wilmington, Delaware

Hans A. Eggerss
President of the Company from December, 1946 to December 31, 1955, date of retirement

Francis L. Elmendorf
Senior Vice President of Robert Heller & Associates, Inc., Cleveland, Ohio, management consultants

[fol. 1790]



H. Bartow Farr
Attorney, partner in law firm of Willkie Owen Farr Gallagher & Walton, New York, N. Y.

Thomas C. Fogarty
President of the Company

John M. Franklin
President of United States Lines, New York, N. Y.

John L. Johnston
Director of Phillips Petroleum Company and Manufacturers Trust Company

Junius S. Morgan
Director and Member of the Executive Committee of J. P. Morgan & Co., Incorporated, New York, N. Y.

William I. Myers
Dean of the New York State College of Agriculture at Cornell University, Ithaca, N. Y.

Sidney J. Weinberg
Partner in Goldman, Sachs & Co., New York, N. Y., investment bankers

Sales pass billion dollar mark for first time

Broader Horizons in packaging through mergers — Hazel Atlas Glass, White Cap and Robert Gair Company

Earnings continue improvement—reach new high levels

1957 outlook – favorable.

HIGHLIGHTS OF THE YEAR

NET SALES
$1,010.3 million

Exceeded by $90.9 million or 8.7% combined 1955 sales of merged companies.

Up $344 million from sales of $666.3 million reported by Continental in 1955.

NET EARNINGS
$3.71 per Share

Compares with $3.22 per share (after 100% Stock dividend) reported by Continental in 1955 and $3.34 per share for the combined companies on a comparable basis.

$68.9 million
before income taxes

Increased $7.2 million from 1955 on combined basis and $40.6 million from amount reported by Continental in 1955.

Represented 6.8% on sales vs. 7.2% reported by Continental in 1955.

$43.1 million
after all charges

[illegible] and $4.3 million from 1955 on combined basis and $18.9 million from amount reported by Continental in 1955.

Represented 4.3% on sales vs. 3.6% reported by Continental in 1955.

COMMON DIVIDENDS
$1.80 per Share

Increased [illegible] $4.50 per share (adjusted for 100% Stock dividend) paid in 1955. On a combined basis Common dividends totalled $20.6 million, compared with $18.5 million in 1955.

The merged companies reinvested 48.5% of the combined net earnings, after all charges, in 1956 and 48.8% in 1955.

EARNINGS RETAINED IN BUSINESS
$60.9 million

PROPERTY, PLANT AND EQUIPMENT (NET)
$245.4 million

Total for combined companies increased $53.7 million from 1955. Increased $134.4 million from total reported by Continental in 1955, including increase of $25 million in timberlands.

NET WORKING CAPITAL
$139.8 million

On a combined basis, working capital declined $10 million from 1955. Compared with the amount reported by Continental in 1955, it showed an increase of $29 million.

PAPERBOARD AND PAPER PRODUCTION
1,018,400 tons

Combined tonnage increased 39,600 tons.

NUMBER OF EMPLOYEES
53,700 average

Compares with average of 53,832 for combined companies in 1955.

TOTAL ASSETS
$998.7 million

Up $62.9 million from combined amount at December 31, 1955.

Represented an investment of $11,762 per employee.

COMMON SHARES
11,174,805 Shares

Represented [illegible] of 1,343,929 shares over shares reported by Continental at December 31, 1955, after adjustment for 100% Stock Dividend.

83,809 Holders

Reduced from 87,981 Holders reported by Continental in 1955.

[fol. 1797] MANAGEMENT'S REVIEW...AND THE OUTLOOK

Once again your Company has established new high records for both sales and earnings, both as it was constituted at the first of 1956, as well as after its mergers with the Hazel-Atlas Glass Company and with the Robert Gair Company. The highlights of the year are shown on the opposite page while a more detailed Financial and Operating Review follows on pages 21 to 25.

On September 13, the Hazel-Atlas Glass Company, an important manufacturer of glass containers, glassware, and metal closures was merged into Continental Can Company; and the merger with the Robert Gair Company, a leading producer of folding cartons, shipping containers, paperboard, and other paper products was consummated on October 26. The operations of these companies for the full year of 1956 have been added to those of the Continental Can Company as it existed prior to the mergers and, where noted, figures for the prior year have been restated for comparative purposes.

We have made every effort to present this information in a form which will enable you to clearly see the effect the addition of these companies has had.

Sales and Earnings

The combined sales for the year were in excess of one billion dollars, amounting to $1,010.3 million. Earnings were $88.9 million before income taxes and $43.1 million after all charges, up 8.8 percent and 11.5 percent from the previous year. These earnings per Common share basis were $3.71 in 1956 as compared to $3.34 per Common share on a comparable basis earned in 1955.

Miscellaneous Acquisitions

During the year your Company also acquired the White Cap Company, manufacturer of metal closures, principally for glass jars, and the Canadian Crown Cork Co., Limited, which makes beer and beverage crown caps. On June 28, your Company entered into a modest investment on an equal basis with the Cochran Foil Company of Louisville, Kentucky, in a plant to manufacture aluminum foil containers.

Your Company started a program of diversification in packaging with the acquisition of a small paper container business in Utica, N. Y. in 1942. Subsequently, companies engaged in the manufacture of crowns, fibre drums, specialty bags, flexible packaging, paper cups, paper plates, and plastic bottles were acquired as a part of the diversification program. These acquisitions were not made merely to increase volume, because it is not the objective of your Management to become big just for the sake of bigness. They fitted into a program designed to give Continental Can Company a well-rounded operation; able to offer quality and competitive service in the broad fields of packaging. The importance of packaging to our economic life, the revolution in packaging methods in recent years, and the continuing

[fol. 1798]

evolution of new materials and new packages convinced us we must be represented in all fields if we hope to satisfactorily serve our customers who, in turn, serve the American consumer. We are well established in the several packaging fields although we are not the largest producer in any major field.

We feel confident of our ability to compete successfully in this dynamic, rapidly growing industry and to apply our research and engineering development to ensure that in the future we shall continue to produce better containers, more efficiently. We do not believe that a container manufacturer can be restricted to the use of a particular material in an economy in which new materials are being developed constantly, and in which old materials are being applied to new and different purposes.

We have tried to point out on pages 8 to 20 of this report the facilities and products which result from these mergers and have presented our philosophy in developing them to produce the packaging of the future.

The government brought suit to stop our acquisition of the Hazel-Atlas Glass Company alleging violation of the anti-trust laws. The courts refused to stop the merger, and the government anti-trust action is still pending. Later, on October 30, following the merger of the Robert Gair Company into your Company, the government brought an anti-trust action in New York, claiming that the merger lessened competition and created a competitive advantage in violation of Section 7 of the Clayton Anti-trust Act. Your Management and its general counsel believe these mergers violate neither the letter nor the spirit of the anti-trust laws. On the contrary, we believe that we bring into the packaging industry a heightened spirit of competition which will benefit both our customers and the consumer.

Management

Four former directors of the Robert Gair Company – George E. Dyke, Raymond F. DeVoe, Robert L. Fitts, and Parker Newhall – were named directors of your Company, with Mr. Dyke also being elected Vice Chairman of the Board. Mr. DeVoe, along with Norman F. Greenway, a senior Vice President of Gair, and Howard G. Lewis, Executive Vice President of Hazel-Atlas Glass Company, became Vice Presidents of your Company. Mr. Fitts also was elected a Vice President, but due to ill-health resigned last month both as an officer and a director. It was with much regret that we accepted his resignation and in his place as Vice President, we appointed John C. Michaud. Arthur G. Chase, a valued director of your Company for many years, now beyond the age limit for directors, resigned as an active director to be designated as an honorary director. Other changes in Management are set forth on page 25 of the Financial and Operating Review of this report.

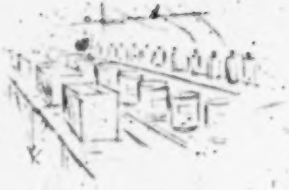
Labor Relations

Our contract negotiations with the United Steelworkers of America (C.I.O.) resulted in the establishment of a three-year agreement on wages with provision for automatic increases on October 1, 1957 and October 1, 1958. We have also entered into three-year agreements with several other unions in our paper container and printing operations. We believe that these three-year con-

tracts will result in further improvement in Labor-Management relations. On the whole, these relations were good in 1956 and contributed materially to the excellent financial showing for the year. We propose to continue our efforts to improve understanding between Labor and Management. We are confident that the people who work for Continental Can Company want to contribute to its progress and that they have a real interest in efficient production.

Capital Expenditures

Your Company spent $80.5 million for capital improvements in 1956, including $6.9 million spent by Hazel-Atlas, $2.5 million by White Cap, and $22.5 million by Robert Gair. In addition to these capital expenditures, $12.1 million were spent for land and buildings on lease-back arrangements.



New plants in process during the year include metal can plants in Cincinnati and in the Metropolitan New York area; a new paper container plant in Three Rivers, Michigan; and a new glass plant in Plainfield, Illinois. Extensive improvements are also being made at the Hopewell, Virginia, and Hodge, Louisiana, paper mills. Your Company continued to acquire woodlands throughout the year to support its several paper mill operations.

We plan to spend $170 million in capital improvements over the next few years exclusive of some additional facilities to be financed on lease-back arrangements. We believe these expenditures are necessary to provide facilities for the expanding markets for our products, and to reduce costs through the introduction of faster and more efficient equipment.

Outlook

We believe that the country will enjoy a high level of economy in 1957, in which there will be continued growth in all segments of your Company's operations. Our plants and facilities are in excellent shape, and with labor peace assured we anticipate another good year. The full advantages of our recent mergers will only begin to show in 1957, as the full savings in overhead to be derived from them must be attained gradually. Nevertheless, we anticipate that these recent acquisitions will contribute their proportionate share to the sales and earnings of your Company in 1957 and even more in the years ahead. Your Management believes the Continental Can Company to be an alert and capable organization which, with the broadened base of products and materials for packaging, expanded research and engineering development, is prepared as never before to meet the ever-changing needs of our customers, for in serving them well we are fulfilling our objective as a company of "Serving Industry – Serving America".

By order of the Board of Directors.

President *Chairman of the Board*

March 11, 1957

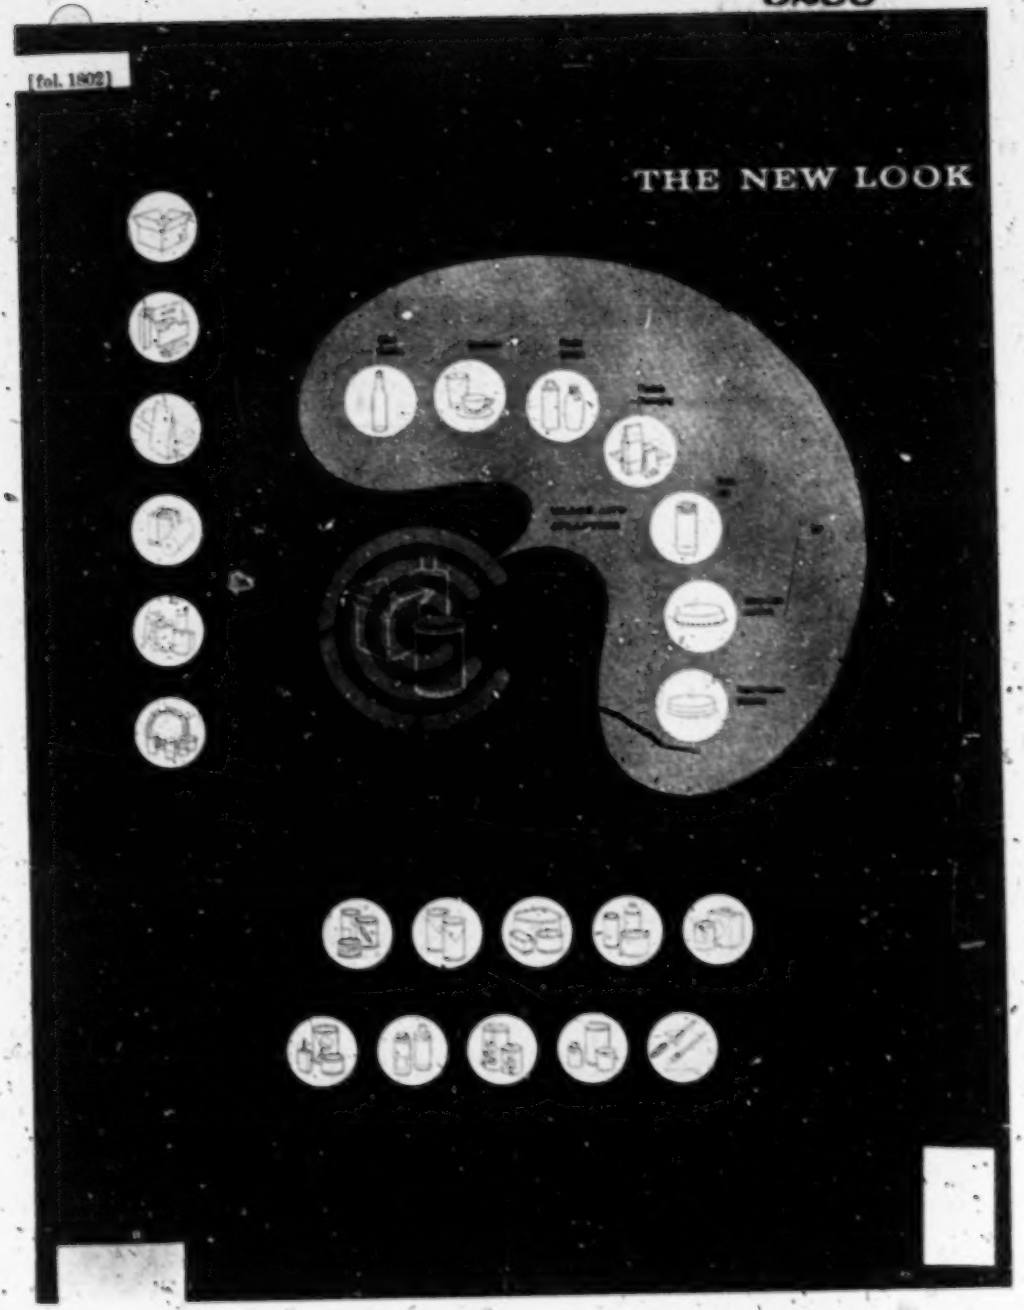
[fol. 1802]



AT CONTINENTAL

The many different types of packages on the preceding page show—at a brief glance—the 'new look' that Continental presented to its Shareholders and customers at the end of 1956.

Many of Continental's Shareholders, customers and friends have known the Company for years. But there are also many newcomers, particularly among the owners of the Company, who are not acquainted with the nature and breadth of our product lines. We believe a review of our products and the place which they hold both in today's markets and in the projected markets of tomorrow will be of interest.

The "WHY" of Packaging's Growth

The packaging industry reflects the dynamic forces which have provided the progress and prosperity which our economy enjoys today. Among the more basic of these are marked population growth, rapid industrial expansion, and the ever-increasing variety of goods and services offered to the American consumer. As our "horn of plenty" becomes more abundant, our need for more and better packaging expands.

This economic growth has been accompanied and aided by strong competitive forces. In the packaging industry the competitive situation can thus spell opportunity for the alert package manufacturer, or hardship for one who fails to recognize and adapt to new developments. For the dominant characteristic of packaging demands today is their variety. At the same time, they call for improvement in quality and manufacturing methods. The focus of these demands is an ever-shifting one—on new merchandising advantages; on low-cost, convenient and more attractive ways of presenting packaged goods.

This process of competitive growth is not new. Just as the railroads shattered the dreams of the canal-builders, just as horses and mules were replaced with the advent of gasoline-powered vehicles, similar changes have taken place, and will continue to take place, in packaging. Half-bushel baskets, cloth bags, wooden barrels—to name just a few, largely have been supplanted by other packages. Consider all the new packaged products that have appeared within less than a generation—detergents, soluble coffee, frozen foods—to mention a few. Consider how differently motor oil, beer, coffee, citrus products, bakery goods and many other commodities were packaged for consumer use 25 years ago.

In keeping with its motto – "Serving Industry – Serving America" – Continental has long pursued a policy of both improving and diversifying its product lines in order to service its varied and ever-broadening customer fields. At the same time it has sought to establish itself among the leaders in each of its packaging fields.

The result of these policies has been a dramatic growth for Continental. Equally dramatic, however, has been the growth of the packaging industry – and more basically, the rise of the American economy and our standard of living. Thus Continental's ten-fold increase in packaging sales during the past two decades has enabled it to do little more than keep pace with the growth of the packaging industry.

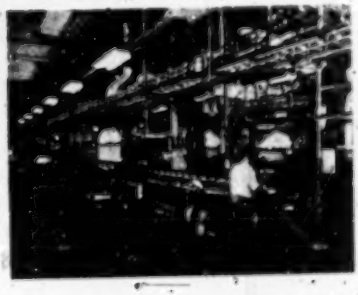
Continental's Present Position

In 1956 Continental became by far the most comprehensive packaging company with the acquisitions of the White Cap Company, the Hazel-Atlas Glass Company and the Robert Gair Company. Continental, as a result, can now supply American industry with a broad line of packaging products and services. It can now meet packaging demands, whether the container required is made of metal, paper, fibre, plastic, glass or composite materials.

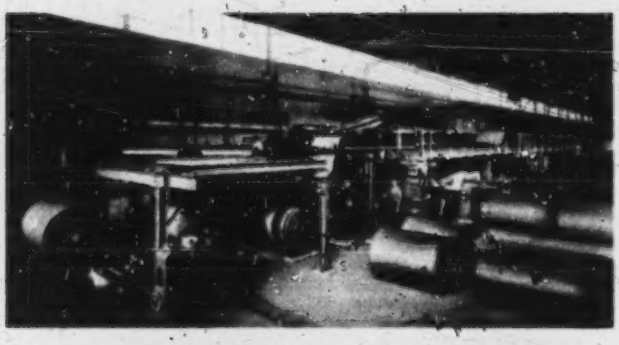
To complement the Company's philosophy of product improvement and diversification, an organization policy of decentralization has been pursued and effected. Leadership in each of the packaging fields is sought by providing individual attention to their respective service and quality needs. Each operating division within Continental performs the sales, manufacturing and research functions in its particular field. Each is an effective industry competitor and equipped to provide the highest quality and service. In addition, the Company is uniquely equipped to deal with the packaging industry as a whole through its broad base of trained personnel, research, and manufacturing knowledge.

Continental's gradual development to its present position has been the result of a long-term Management philosophy stemming from a belief in America's economic expansion and the natural corollary of industry's increasing need for better and more varied packaging. This philosophy and the

In a Continental equipment manufacturing division plant, many types of machines are built for our can manufacturing plants.



The can body forming and side seam soldering operations are made on one machine in a can plant, after which the cans are conveyed at right for flanging of tops and bottoms.



On this combiner at Gair Company of Canada Limited's Toronto Container Plant, liners are heated from three separate reels as they are brought together to form a single web of corrugated board for shipping containers.

development it has fostered also serves to protect and improve the shareholders' position. The assets of the Company represent a strategically located group of facilities to produce a range of product lines which can meet packaging problems where and when they occur. Most important, they represent a breadth of knowledge and a devotion to research and development, both of which are essential in serving America's packaging needs.

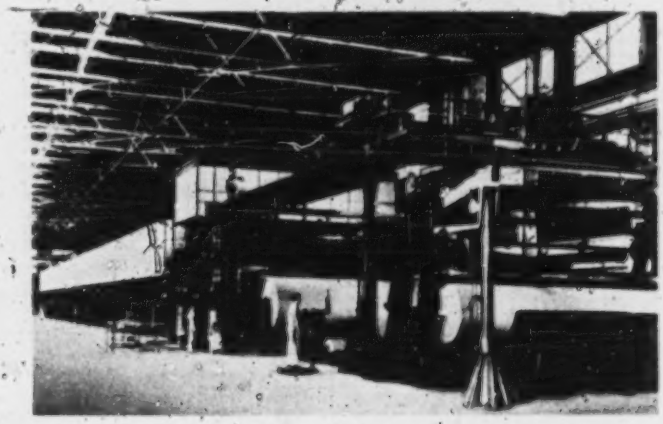
Of prime importance to the Company and its shareholders are the many customers and, in turn, their customers who are the final arbiters of packaging progress. The Management feels that its own growth is evidence that Continental's philosophy in the packaging field is in the best interest of its customers.

Importance of the Gair Merger

The Robert Gair Company is a major producer of folding cartons, shipping containers and kraft bags and gives Continental a broadened product scope in the paper field. Gair facilities include a total of 37 plants in the United States and Canada. Of this number, 26 are in the United States, 10 producing folding cartons and 14 producing shipping containers. All of these plants are strategically located to serve major consuming areas. The Gair Company also brought to Continental two mills, one at Hodge, Louisiana, and the other at Port Wentworth, Georgia. Both are substantial producers of container board. In addition the Hodge mill produces kraft paper. A substantial bag fabricating operation is also carried on at that location. The merger increased Continental's timberland resources so that Continental's operations are now supported by about one million acres of timberland. Forest management thus has become a major activity of the Company. More than 18 million seedlings are being planted during the 1956-57 season to protect and improve these valuable woodland assets.

The Robert Gair Company began its long history just after the Civil War when a young man from Scotland, who gave his name to the firm and became an important influence in the new field, founded the Company in Manhattan.

This 430-foot Fourdrinier kraft paperboard machine at the subsidiary Southern Paperboard Corporation's Port Wentworth, Georgia, mill turns out a continuous sheet of board 20 feet wide at speeds of fourteen hundred feet a minute.



A roll of boxboard is moved from the dry end of a cylinder paperboard machine at the Tonawanda, New York, boxboard mill to a rewinder, where it will be cut into smaller rolls.

In those days of wooden barrel packaging and ancient merchandising systems, Mr. Gair found plenty of room for new ideas. In 1879 he devised a system to produce folding cartons economically and this played an important part in revolutionizing the ability of packers to ship their wares efficiently and over wider areas. About the turn of the century, with the folding carton a success, Gair began producing shipping containers and, as demands for modern packaging increased, so did the demand for raw material. Therefore, Gair began acquiring paperboard mills and more fabricating plants and later its own timberlands. More recently, it began producing kraft bags and wrapping papers.

The Gair product line has been well adapted to the very rapid growth in demand for paper and paperboard packaging products in recent years. Highlights of recent Gair developments in the product field include the introduction of the Jak-Et-Pak, a new multiple-pack can carrier, together with a high-speed machine for the package assembly; a new stabilized boxboard giving protection against rancidity and a special boxboard that inhibits corrosion of metal parts.

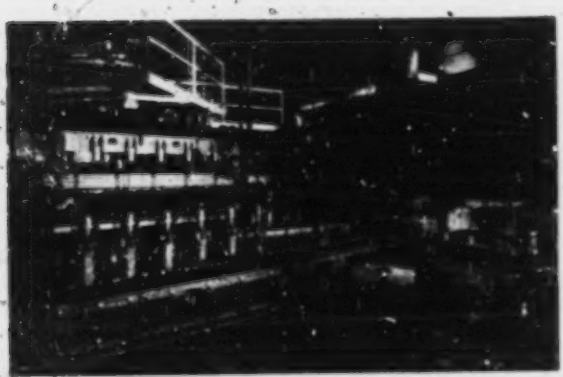
Our Entry Into the Glass Field

Glass containers and glassware were added to the Continental product line by the Company's recent acquisition of the Hazel-Atlas Glass Company. The packages produced by Hazel-Atlas complement, rather than compete with, Continental's previous product lines. Continental proposes to promote vigorously the sale of glass containers and to strengthen the historical position which Hazel-Atlas has enjoyed in the glass container industry. Continental now can also provide an extensive line of glassware and industrial items.

Hazel-Atlas' present facilities include 14 plants spotted from coast to coast. One of the most modern plants in the industry was just placed in operation by the division at Plainfield, Illinois.

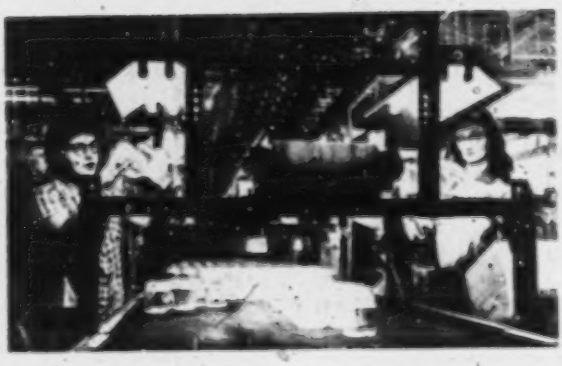
A program for modernization and improvement is currently under way. The program includes entry into new container fields, erection of new plants, enlargement and modernization of existing plants and installation of the latest glass-making equipment.

The White Cap Company, acquired early in 1956, is the foremost producer of metal vapor-vacuum closures and has pioneered the vapor-vacuum closing method. Outstanding in recent developments by this company is the new twist-off cap. Such developments promise to maintain White Cap's leadership position.



A modern, high speed machine forms the necks and then blows out six containers to their precise shape. The containers then are carried to the lehr (oven) at right for annealing.

Sand, limestone, and other raw materials flow from the batch mixer through automatic feeders into a glass furnace.



Two inspectors visually check quality of finished glass containers as they are carried from the lehr on a lighted conveyor.

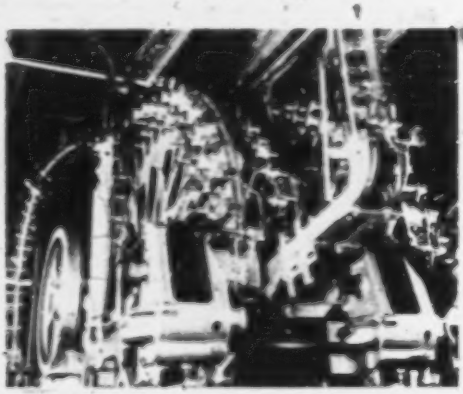
Progress in Metal Cans

The dramatic appeal of diversification of the product line may cause some observers to lose sight of the real and substantial progress made by Continental's older divisions during 1956.

The metal can was by far our most important product in 1956, as it has been in every year since the Company opened its first plant in Syracuse, New York, in 1905. Our metal operations again demonstrated their leadership this year through a marked increase in volume, and the contribution of a number of advances in production and container technology. Among the latter, the year saw wide acceptance in the beverage industry of the "Cushion Seal" can end, which provides positive protection against metal exposure for beer and other beverages. The new "Savorlock" can, which features both a tamper-proof seal and firm reclosure, demonstrated its advantages for the marketing of powdered products. The "Gripstrip" self-tracking rip strip quickly became a standard feature of key-opening cans for such items as coffee and meat. The new outside-curled paint can for water-base and latex-base paints received wide acceptance. Also the merchandising advantages of, and the market for, aerosol cans were broadened by the first successful side seam striping, which makes possible a uniform color over the can's entire surface.

Continental's ability to generate an ever-increasing flow of new and improved cans, together with the machinery to produce and close them, received real impetus during the year with the opening in Chicago of the world's largest integrated research and development center for metal cans. The year also saw the completion nearby of a new research and engineering center devoted to basic research covering the entire packaging field. These two centers, employing about 700 scientists and technicians, serve as active symbols of Continental's determination to provide leadership in each of its packaging fields while contributing those advances which can spring only from an intimate knowledge of all fields. Thus the one center is devoted entirely to the metal field and is closely geared – as is each of our division research operations – to the materials, machinery and containers used by or produced by the division. The other center looks to the future and is free to roam the frontiers of packaging.

The double seaming machine is fed with can ends by an operator and assembles the bottoms to the can bodies as they are hermetically sealed.



A rotary air tester is used to make sure there are no leaks in the cans. Test cans with minute holes are sent through periodically for protection against machine failure.

Progress in Other Products

As in the case of metal cans, diversification into glass and paper products did not diminish the vigor of facility and product improvement in the divisions which comprised the Continental of 1955. In each of these divisions, Continental had entered a packaging field by the acquisition of a relatively small company, but its growth in each field has been mainly through internal expansion and development of equipment and facilities.

The Company's Paper Container Division has for several years been a major producer of drinking cups and paper tubs. Recently it added a line of plastic coated paper plates and paper containers with metal lids. Last year its "Bondware" line of paper plates and cups was augmented by a new "Silver Service" line of foil-laminated plates and by various "Bonded Finish" products having the appearance of fine china. New lines of plastic cups and containers for dairy products and other foods were added during the year. In 1957 this division will begin operation of its new Three Rivers, Michigan, plant, one of the most modern in the industry.

The Company's fibre drum business dates from December, 1942, when it acquired a company with one plant in production. Since that time, five additional plants have been established to take care of the growing demand for this package for use in the shipment and storage of dry chemicals and other dry products. The division's newest plant was put in operation last summer at Midland, Michigan. The recent addition of the "Liquipak" fibre drum to its line, which is suitable for the packaging of many liquid products, resulted from Continental's research work.

The Crown and Cork Division operates six plants. Its products have been expanded in recent years to include plastic "squeeze" bottles, molded and vacuum-formed plastic containers and "Conolite", a plastic laminate used for surface coverings, electrical insulation and other purposes. A new line of "short-skirt" crowns introduced by the Company last year marked a major development in this field. These caps use less steel, require less storage space and are made with either a plastic or cork lining.

The Company's Shellmar-Betner Division started in 1953 as a combination of the flexible packaging business acquired from Shellmar Products Corporation and the bag business acquired from the Benjamin C. Betner Company. Eight plants are now in production on this line of products which includes the extrusion of polyethylene and the lamination, printing and conversion into bags and containers of various types of papers, foils and films. One of the most recent additions to its product line is "Conomet", a metalized yarn produced under the Company's process of applying vaporized metals to mylar and other materials. The recent trend to individual packaging of meats, vegetables, foil packaging for frozen foods and bakery products and transparent bags for textile products has added to the division's products.

Aluminum foil containers were added to the Company's product line through a joint venture started last year with Cochran Foil Company of Louisville, Kentucky through the formation of the Cochran Continental Container Corporation.

Future Plans

The foregoing pages have reviewed some phases of the Continental of 1956. There is no safe way to predict the exact composition of the Continental of 1966 or 1976. No one knows precisely how large the population will become in the next 20 or even the next 10 years, how the country's economic growth will fare, or what scientific and technological developments will affect our consuming habits. Most "experts" who guess at these trends have revised their figures upward from earlier projections. As in the past, Continental's future is closely tied with that of the general economy. The Company continues to have faith in that future and in the new merchandising trends that will take place with scientific research unveiling new ways to bring products to the American public more economically and efficiently. Again, as in the past, these varied forces of change present opportunities for progress as well as challenges to tradition.

Looking to this future, the Company has joined with nine other companies in varied industries to begin construction this year of a nuclear reactor at Plainsboro, New Jersey. Continental's scientists will use the facility to make long-range studies of how gamma rays affect packaging materials and how radiation can best preserve foodstuffs and other products. This is an area of activity that poses many problems and much potential.

The Company will continue constantly to seek out opportunities to improve and broaden its services to customers. Besides research activity devoted to the discovery and creation of better materials and improved methods for packaging, the Company will search for opportunities to extend present day packaging to products still sold in bulk and to promote the packaging of new products as they come on the market—always in whatever way consumers may prefer.

We are confident that the demand for the Company's products will more than keep pace with the country's expanding economy. The Company expects to continue to develop leadership in packaging with its eyes firmly on the future in "Serving Industry—Serving America."

Continental will research the broad effects of radioactive preservation of foods at this nuclear reactor, shown in model form, being constructed this year at Plainsboro, New Jersey

FINANCIAL AND OPERATING REVIEW

Sales and Earnings

Sales and earnings broke all records both before and after giving effect to the mergers with Hazel-Atlas Glass Company, Robert Gair Company, and White Cap Company. Net sales totaled $1,010,268,000, compared with $929,428,000 in 1955 for the merged companies—an increase of $80,840,000 or 8.7 per cent.

As shown in the table below, all product groups contributed to the increase.

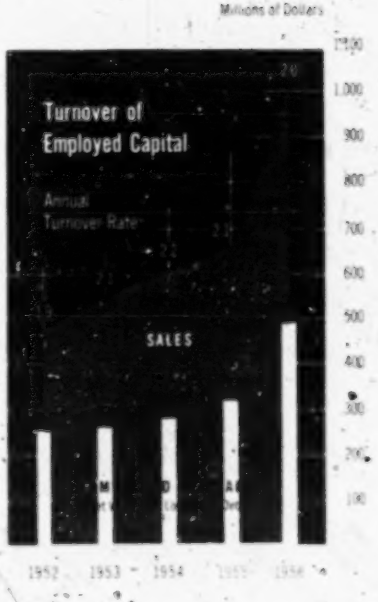
Sales by Product Groups (Expressed in Millions of Dollars)

Product Group	1956 Total	1956 % of Total	1955 Total	1955 % of Total
Metal Operations	$ 533.5	52.8	$478.4	51.5
Glass and Plastic Operations	160.2	15.9	156.0	16.8
Paper Operations	261.2	25.9	241.0	25.9
Other Operations	55.4	5.4	54.0	5.8
Total	$1,010.3	100.0	$929.4	100.0

After income taxes and minority interest in income of a subsidiary, net earnings amounted to $43,143,000 or 4.3 per cent on sales compared with $38,693,000 or 4.2 per cent on sales in 1955. After preferred dividends, earnings were equivalent to $3.71 per share on 11,174,805 shares of common stock, as against $3.34 on 11,115,515 shares in 1955, after adjustment for the 100 per cent stock dividend distribution by Continental on February 15, 1956, and the shares issuable in connection with the above mergers.

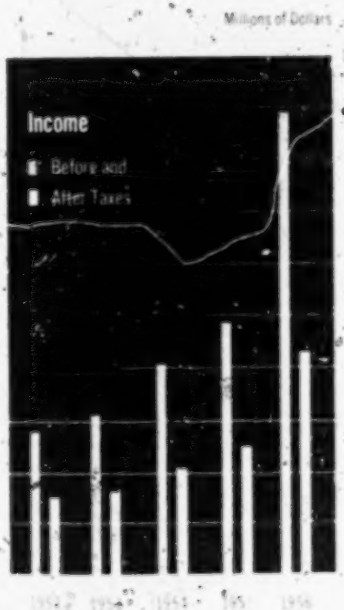
Earnings before income taxes in 1956 amounted to $88,861,000 or 8.8 per cent on sales, compared with $81,649,000 or 8.8 per cent on sales in 1955.

Depreciation and depletion provided out of operating income amounted to $23,421,000 in 1956, against $22,195,000 in 1955. Accelerated depreciation under approved Necessity Certificates, included in these totals, amounted to $1,329,000 in 1956 and $1,306,000 in 1955. For tax purposes, but not for book purposes, capital expen-



ditures since January 1, 1954, have been depreciated on "the sum of the years–digits" or "declining balance" methods. This has had the effect of reducing income taxes for the year 1956 by approximately $1,300,000 and for the year 1955 by about $750,000.

Dividends paid by the merged companies on the Preferred stock issues amounted to $1,628,000 and on their respective common shares totaled $20,596,000. After providing for these dividends there remained $20,919,000 or 48.5 per cent of total net earnings, which were reinvested in the business. In addition to regular dividends on the $3.75 Cumulative Preferred stock and on the Second Preferred stock ($4.50 cumulative), regular quarterly dividends of $.45 per share were paid on the Common stock on March 15, June 15, September 15, and December 15. A 100 per cent stock distribution was also paid on February 15, 1956, to holders of Continental Can shares of record on January 10, 1956.



The ratio of current assets to current liabilities on December 31, 1956, was 2.1 to 1, which compares with the ratio of 2.9 to 1 on December 31, 1955. Current assets totaled $271,630,000 and current liabilities $131,807,000. Working capital of the merged companies decreased during the year from $169,863,000 to $139,823,000. This was due principally to the large capital investments in new and improved facilities and timberland additions.

Gross capital expenditures during 1956 totaled $80,524,000. Of this amount $6,851,000 represented expenditures of Hazel-Atlas Glass Company prior to its merger with Continental Can Company and $22,516,000 represented expenditures of Robert Gair Company prior to its merger with Continental. The expenditures of Continental included the acquisition of land in southern Michigan as a future metal can plant site; increase in facilities for the production of metal cans for beer, fruits and vegetables, coffee, oil, shortening, meat, and detergents and lithograph equipment at various plants in the United States and Canada; the erection of new warehouses at Los Angeles and Chicago; improvements to the Central Research and Engineering buildings at Chicago; expansion of the flexible packaging operations at Mount

Vernon, Ohio, and installation of new gravure color presses, laminator equipment, and bag machines at various locations. The expansion of the Company's Hopewell, Virginia paper mill to include a semi-chemical pulp operation was completed during the year and is now in production.

The expenditures of Hazel-Atlas Glass included the construction of a new warehouse at Ada, Oklahoma, the equipping of its new glass plant at Plainfield, Illinois and the installation of new high speed forming machines, decorating equipment, and other glass-making equipment at various locations.

The expenditures of Robert Gair included carrying forward the program of improvements at the Hodge, Louisiana, pulp and paper mill, substantial additions to timberlands, particularly in the area immediately adjacent to Hodge and the erection of a new corrugated box plant at Cleveland, Ohio, to replace one formerly operated in rented property.

Organization Changes

In addition to the organization changes referred to in the Management Review section of this report on page 4 affecting the directors and certain officers of the acquired companies, the following additional changes in the Management have also occurred: Carl E. Eggerss, Vice President, Fibre Drum Division, and Paul E. Pearson, Research and Engineering Consultant, retired during the year under the Company's retirement plan. Mr. Eggerss was succeeded by Peter P. Wojtul, formerly Vice President-Sales, who became Vice President and General Manager of the new Fibre Drum and Corrugated Box Division, and Raymond G. Fisher became Director of Sales Research and Promotion. Lawrence Wilkinson was designated as Executive Vice President of the Glass and Plastic Operations Group and George E. Dyke, Vice Chairman of the Board, was placed in charge of the Robert Gair Paper Products Group. Benjamin C. Betner, Jr., formerly Vice President, Shellmar-Betner Division, was appointed as Vice President, Sales—Glass and Plastic Operations Group. Raben C. Schenk, formerly Control Officer, as General Manager, Shellmar-Betner Division; and Howard T. Heun as Control Officer. James J. Donahue, former Sales Manager, General Line (Eastern Metal Division), became General Manager of Sales for the Hazel-Atlas Glass Division. John N. Carty and Ernest Meyer, former treasurer of Robert Gair, were appointed Assistant Treasurers. Harold von Hasslacher, former assistant comptroller of Robert Gair, was appointed an Assistant Comptroller.

Employee Group Insurance and Pensions

Under the Company's group insurance plan, employees, and to some extent their dependents, are covered by a comprehensive non-contributory group insurance program including hospitalization, surgical, health and accident, physicians' attendance, and life insurance benefits. The net cost per year to Continental of this group insurance for its employees for the policy year ending June 30, 1956, prior to the effective date of the mergers, was $5,813,742 compared with $5,066,380 for the previous policy year. On December 31, 1956, a combined total of $364,122,800 of life insurance was in force for 53,991 employees of the merged companies (including $7,164,425 for retired employees). During the latest policy year, the total claims paid by insurance companies to employees and dependents of the merged companies amounted to $6,805,391, of which $1,654,934 was for death claims.

At year-end there were 1172 employees retired and receiving monthly pensions under the various retirement plans of the merged companies. This represented a net increase of 389 persons during the year. During 1956 a total of $6,000,000 was provided for the Continental Pension Fund for United States employees and $492,000 (Canadian) for employees of Continental Can Company of Canada, Limited. This compared with 1955 figures of $5,400,000 and $444,000 (Canadian), respectively. In addition, a total of $2,340,042 was provided in 1956 for the pensions of Hazel-Atlas, White Cap and Robert Gair employees.

Stock Option Plan

On March 14, 1956, options to purchase 16,200 shares of Common stock at a price of $40.25 per share were granted to nine key employees under the existing plan approved by the Shareholders in 1951. During the year, a total of 31,444 shares of the authorized but unissued Common stock was sold to 68 employees upon exercise of purchase options under the plan, including shares issued to cover the adjustment for the 100 per cent stock distribution of February 15, 1956.

At December 31, 1956, 101 key employees held options to purchase a total of 228,100 shares of Common stock under the plan after giving effect to the 100 per cent stock distribution of February 15, 1956, where applicable. Of this total, 42,556 shares were granted in June, 1951, at a price of $17.50 per share, 16,164 shares in December, 1951, at a price of $21.375 per share, 65,728 shares in June, 1953, at a price of $24.125 per share, 88,336 shares

in December, 1955, at a price of $38.75 per share, and 15,376 shares in March, 1956, at a price of $40.25 per share. All of these options are exercisable in equal annual instalments from the date granted and expire on June 21, 1961. The price of the shares in each case is approximately 95 per cent of the market price on the date the option was granted after adjustment for the 100 per cent stock distribution mentioned above, where applicable.

Our Shareholders

On December 31, 1956, there were 1,206 holders of the outstanding 150,000 shares of $3.75 Cumulative Preferred stock, 2,288 holders of the outstanding 234,380 shares of Second Preferred stock and 53,809 holders of the outstanding 11,174,805 shares of Common stock, of which 34 shares are represented by fractional scrip certificates.

On December 3, 1956, the record date of the last 1956 Common dividend, the Common shares were distributed as follows:

Shares Held By	Number of Holders	%	Shares Held	%	Average No. Shares Per Holder
Men	19,578	36.5	2,471,095	22.4	126
Women	21,595	40.2	2,214,126	19.8	103
Joint Tenants	7,270	13.6	405,584	3.6	56
Fiduciaries	3,057	5.7	1,037,339	9.3	339
Brokers	328	.6	894,229	8.0	2,726
Nominees	643	1.2	3,153,353	28.2	4,904
Institutions and Foundations	369	.7	195,309	1.8	529
Corporations, Insurance Companies, Investment Trusts, etc.	807	1.5	803,258	7.2	995
TOTAL	53,647	100.0	11,174,293	100.0	

Of the total number of shareholders shown in the table above, 469 holding 87,520 shares were located in foreign countries; 7,280 or 14% held 10 shares or less, and 11,845 or 22% owned over 100 shares each.

		$163,878		$189,369
Appropriated for Common Stock Distribution on February 15, 1956			$46,245	
Expenses Applicable to Mergers, Less Portion Charged to Capital Surplus			165	46,410
Earnings Retained in the Business, December 31		$163,878		$142,959

NOTE: Retained earnings as of January 1 of each year includes $9,700,000 appropriated for excess replacement costs of fixed assets and $6,170,000 appropriated for inventory price decline or other contingencies.

See Notes on Pages 11 and 12.

CONTINENTAL CAN COMPANY, INC.

Statement of Consolidated Capital Surplus

For the Year Ended December 31, 1956

		In Thousands of Dollars
Balance, January 1, 1956		$58,635
Restatement of January 1, 1956 Balance to give effect to mergers during 1956, as follows:		
(a) Capital Surplus of company acquired on merger basis, as of January 1, 1956—White Cap Company	$ 306	
(b) Reduction in Par Value of Common Stock from $20 to $10 per share approved in connection with Robert Gair Company, Inc. merger	36,644	
(c) Reduction in amount appropriated in 1955 for 100% Stock Distribution resulting from above reduction in Par Value of Common Stock	38,747	
	$75,697	
(d) Less—Excess of Par Value of shares of Continental Can Company, Inc. Common Stock ($10 per share) over aggregate Par Value of shares of merged companies exchanged therefor	22,547	53,150
Balance, January 1, 1956, as Restated		$58,785
Surplus arising from reduction in Par Value from $20 to $10 per share applicable to 210,000 shares of Common Stock issued in exchange for White Cap Company Capital Stock	$ 2,100	
Excess of consideration received over Par Value of Common Stock sold under the Employees' Stock Purchase Plans	437	
Excess of Par Value of Second Preferred Stock converted during the year over Par Value of Common Stock issued in exchange therefor	302	
	$ 2,839	
Less-Expenses in connection with mergers	958	1,881
Balance, December 31, 1956		$60,666

[fol. 1825]

Notes to Financial Statements

Note 1

During 1956, the Company acquired, on a merger basis, all the outstanding stock of White Cap Company and the net assets of Hazel-Atlas Glass Company and Robert Gair Company, Inc. The accompanying statements of income and earnings retained in the business include the results of the 1956 operations of the merged companies for the entire year, with comparative 1955 combined figures. The combined balance sheet as at December 31, 1955 has been compiled for comparative purposes as if the mergers had taken place at that date. Earnings per share are expressed in terms of the number of shares outstanding (as restated in 1955) at the respective year-ends.

Note 2

Inventories are stated at the lower of cost or market. Cost for this purpose represents standard, average, or actual cost with respect to 77% of both the 1956 and 1955 combined inventories and "last-in, first-out" (LIFO) cost as to the remaining 23%.

Note 3

Investments are stated at cost, which is less than value based on market quotations.

(Continued)

Note 4

Long Term Debt comprises the following:

In Thousands of Dollars

	December 31, 1956	December 31, 1955 Combined (Note 1)	December 31, 1955 As Previously Reported
3½% promissory note due May 25, 1961	$ 2,993	$ —	$ —
3½% promissory notes due May 3, 1963	6,769	8,000	
3½% sinking fund debentures due December 1, 1965	1,496	1,496	1,496
3¼% debentures due October 15, 1976	13,200	13,650	13,650
3¼-3½% sinking fund debentures due November 1, 1995	39,502	39,502	39,502
3¼% promissory notes due November 1, 1995	25,000	25,000	25,000
4% first mortgage loan due July 1, 1962	186	696	
4½% promissory notes due July 1, 1982	27,000	27,000	
	$116,346	$115,344	$ 79,648

Note 5

The Company's Certificate of Incorporation and various promissory notes and indentures relating to the Company's debentures limit the amount which may be expended for the payment of cash dividends and the purchase, redemption, or retirement of the Company's capital stock. At December 31, 1956, under the terms of the most restrictive of these documents, the Company could not apply more than approximately $41,300,000 to such purposes.

Auditors' Report

HASKINS & SELLS

February 16, 1951.

To The Board of Directors and Shareholders,
Continental Can Company, Inc.:

We have examined the consolidated balance sheet of Continental Can Company, Inc. and its subsidiary companies consolidated as of December 31, 1950 and the related statements of consolidated income and earnings retained in the business for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying consolidated balance sheet and statements of consolidated income and earnings retained in the business present fairly the consolidated financial position of the companies at December 31, 1950 and the consolidated results of their operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

NOTICE OF MEETING

The Annual Meeting of the Shareholders will be held at the Biltmore Hotel, Madison Avenue and 43rd Street, New York City, on Tuesday, April 22nd, 1958, at 11 o'clock A.M., New York City time. Proxies and proxy statements for such

Management's Review . . . and the Outlook

While we entered into 1957 with confidence that it would prove our best year, we had to be satisfied with our second best performance. This resulted in part from the slowdown in business activities during the latter part of the year, which made our growth less than expected, and also in part from the integration of two companies merged with us in 1956. The integration, largely completed, promises well for future operations.

OPERATIONS

Metal sales accounted for a little more than half of our operations in 1957. However, physical volume, expected to establish new records, was below estimate due primarily to smaller seasonal packs in many of the fruit and vegetable growing areas. New can plants were completed serving the Metropolitan New York and Cincinnati areas. These are now in production.

The Paper Container Division, producing paper and plastic drinking cups; paper tubs; paper, plastic and foil-laminated plates, opened a new atmosphere-controlled plant at Three Rivers, Michigan, during the last quarter of 1957. Operations formerly conducted at the Memphis, Tennessee, plant were transferred to the new plant.

During 1957 your Management concentrated its efforts to improve and to integrate the operations of its new businesses. Marginal plants and product lines were discontinued, studies were made to permit facilities and technological skills to be more profitably employed, and new facilities and equipment were provided and programmed to bring all plants up to date.

A particularly large equipment replacement program was completed in the Hazel-Atlas Glass Division and a new glass plant at Plainfield, Illinois, was brought into production. To enable this division to compete in markets which could not be supplied by its existing production facilities, modern and more

[fol. 1836]

Dollar sales hit new peak of $1,096 million — up $36 million from 1956
Physical volume down slightly

Net Income of $81.3 million before income taxes and $41 million after all charges compared with $88.9 million and $43.1 million, respectively in 1956

Net Earnings equal $3.52 per Share vs. $3.71 in 1956

flexible equipment was installed at various plant locations. Twenty-four of these new lines are now in operation and gradually reaching a satisfactory performance record. In addition, existing equipment was renovated to make it more efficient, and a marginal plant was converted to a research and development laboratory. These activities threw a heavy burden on the Hazel-Atlas organization and resulted in a substantial reduction in operating income. However, these changes were essential for it to become competitive, and your Management is confident that half-way measures would have cost more in the long run.

J. Gordon King was appointed general manager of the division to succeed Howard G. Lewis, who retired. Mr. King has been long identified with the glass and plastic industry. We believe that the revitalized Hazel-Atlas Division will soon begin to contribute its share of Company income.

The White Cap Company, a wholly-owned subsidiary acquired early in 1956, had a most successful year following its introduction of the new twist-off cap for jars and bottles. To reduce overhead and improve efficiency, the Crown and Cork Division was combined with White Cap to form the new White Cap and Bond Crown Division. Philip O'C. White, president of the subsidiary and a vice president of the Company, was appointed general manager of the new division.

The Robert Gair Paper Products Group did not escape from the common experience of paper and paperboard producers in having a lesser production in 1957 than in 1956. However, the diversity of the packaging products of this group enabled it to improve its profit margin so that earnings held fairly close to 1956 income. A substantial modernization and expansion program was completed at the kraft bag and paper plant in Hodge, Louisiana, with the installation of a fourth Fourdrinier paper machine and auxiliary equipment. A new folding carton plant was completed at Winnipeg, Manitoba, and a corrugated box plant at Cleveland, Ohio.

George E. Dyke, vice chairman of the board and acting executive vice president of the Robert Gair Paper Products Group, resigned from these offices at the end of the year and will give us the benefit of

[fol. 1837] 3334

Profit margin on sales 7.8% before income taxes and 3.9% after all charges, compared with 8.8% and 4.3% for 1956.

Common dividends of $1.80 per share totalled $20.1 million, compared with $20.6 million in 1956.

Earnings reinvested in the business of $19.3 million represented 47.0% of net earnings, compared with 48.5% in 1956.

his broad experience as a consultant during 1958. Norman F. Greenway, vice president and general manager of the Boxboard and Folding Carton Division, assumed the position of executive vice president of the Gair Group. He was in turn succeeded by William H. Caddoo, formerly general manager of manufacturing for the division.

William M. Allin, former general sales manager of the Containerboard and Kraft Paper Division, was appointed vice president and general manager of the division, succeeding John [illegible] Michaud, who resigned. This division operates three kraft paper mills, two wholly owned and one majority owned, and our woodlands. Forest holdings located in Virginia, the Carolinas, Georgia, Florida, and Louisiana increased by almost 67,000 acres during the year. Tracts comprising about 63,000 acres in Arkansas, beyond reasonable transportation costs to our mills, were sold at a profit. At the end of the year, we held in fee or on long-term leases approximately 970,000 acres.

We will plant about 25 million trees during the 1957-58 season, of which 21 million will come from our forest nurseries in Georgia and Louisiana, and the remainder from various state nurseries. A new nursery with a capacity of 10 million seedlings a year is now under construction in Virginia.

CAPITAL PROGRAM

Our capital expenditures during the year totalled $62.3 million, while an additional $13.7 million was spent on "sale and lease-back" arrangements for land and buildings. This compared with $80.5 million capital expenditures and $12.1 million on "sale and lease backs" during 1956 for the combined companies. Our program for 1958 calls for expenditures of $40 to $45 million, making a total for the three-year period of over $200 million.

To replenish working capital, in December the Company borrowed $20 million from several banks on

[fol. 1838] *Capital expenditures totalled $62.3 million, including $3.0 million for timberlands*
Net value of Property, Plant and Equipment increased $33.4 million to $376.8 million at end of 1957

Timberlands owned or leased amounted to 970 thousand acres at end of 1957

Paperboard and paper production of 989 thousand tons in 1957, compared with 1,028 thousand tons in 1956

4½ per cent notes, of which $10 million is payable April 15, 1959, and $10 million is payable January 16, 1961. Also, arrangements started in August were concluded on November 15, 1957, for the borrowing from three insurance companies of $35 million at 5 per cent, due in 1980 and available in future installments of $15 million on April 10, 1958, $10 million on April 9, 1959, and $10 million on January 7, 1960.

Although this latter financing is not specifically ear marked, the funds as provided will approximate the progressive cost of constructing a new bleached paperboard mill over the next three years as programmed.

RESEARCH AND ENGINEERING

Central Research and Engineering, now housed in its new and well equipped building, built up its research staff during the year to about three-fourths of planned strength. It is now carrying out applied research and engineering investigations of longer range and more fundamental nature than those conducted by the research and development departments of the product divisions.

Combined, these research and engineering groups are budgeted to spend over $15 million during 1958. They utilize the services of more than seven hundred scientists and engineers engaged in improving the packaging products which we offer to the public. Without them, we could not progress.

During the year, Continental combined with Armour and Company, Food Machinery and Chemical Corporation, and General Foods Corporation to bid on and receive a contract from the Army Quartermaster Corps to participate in setting up the world's first food radiation center. Irradiated Products, Inc., which is the name of this joint venture, is charged with assisting the Quartermaster Corps in plans for the U.S. Army Ionizing Radiation Center, construction of which will start in 1958.

The research reactor and laboratories of Industrial Reactor Laboratories, Inc., a cooperative project in which Continental is working with nine other companies and Columbia University, are expected to be

[fol. 1839]

3336

Net Working Capital increased $3.2 million to $143.1 million at December 31, 1957

Total assets increased $30.4 million to $664.1 million at December 31, 1957

Number of employees increased during 1957 from an average of 53,756 to 53,886

At the end of 1957, 11,202,778 common shares were held by 53,127 shareholders, compared with 11,174,805 shares and 53,809 holders at December 31, 1956

completed in the third quarter of 1958. Continental's scientists will use these facilities to study the effe of radiation on various forms of packaging and their contents.

C. L. Adcock, director of technical development, retired during the year and was succeeded by J G. Murray, who had been vice president and general manager of the Crown and Cork Division. Mr. Mur also continues as a vice president of the Company.

EMPLOYEE RELATIONS

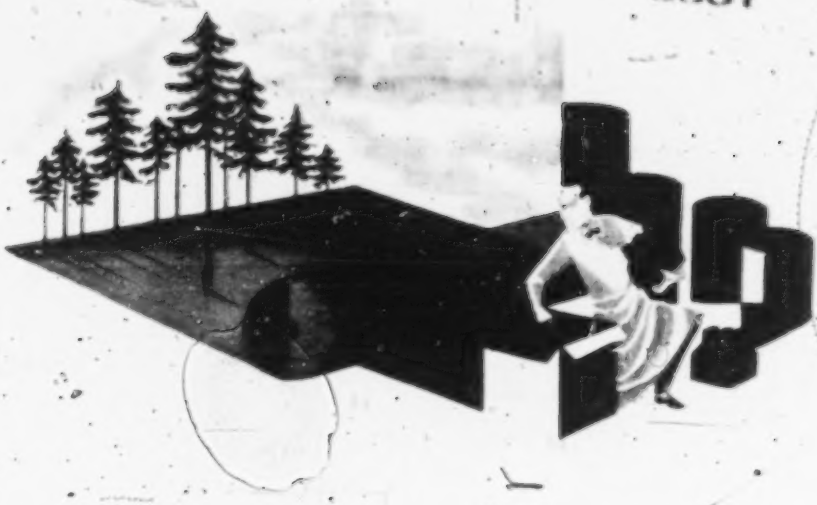
As a result of the three-year agreements signed in 1956 with the United Steel Workers of America other unions, we have had excellent relations with our employees throughout 1957. The one exception a twelve-week strike at one of the plants of the Robert Gair Paper Products Group. Industry-wide nego tions in the glass container field were satisfactorily concluded with a two-year contract which, like o multi-year agreements, will provide for automatic wage increases this year for members of the two un involved.

PRODUCT DEVELOPMENT

In early 1958 we delivered the first deep-drawn aluminum cans to be used in this country for proce meat products. In addition to these and conventional three-piece aluminum cans, which we can now duce commercially, we will market aluminum cans formed by impact extrusion later this year. Your M agement does not view aluminum as a substitute for tinplate, but rather as a material which will ex the metal container line of products.

Aerosol or pressure-dispensing cans continued to grow in favor during 1957 as new valves and pellants were developed. A still faster growth is expected in 1958.

[fol. 1840]



During the year, we accelerated development programs to broaden our line of composite containers those in which two or more different materials are used, such as cans with plastic bodies and metal ends. Substantial progress has been made in the use of various paper, plastic, and metal laminates.

Other types of packages which the Company believes of promise include biodegradable milk packs for cans and bottles; large multi-wall bags, which we will begin to market in 1958, and flexible packaging, which is finding wider acceptance for bakery goods, meats, and produce.

THE OUTLOOK

In its planning for the future, your Management has taken cognizance of the present state of our economy and has shaped its policies on capital expenditures and other long range commitments accordingly. The key elements affecting the outlook for packaging are consumer income and expenditures for packaged goods, both of which are expected to continue at high levels in 1958. The expanding population and the trend to better packaging are encouraging factors.

For these reasons, we believe that your Company will gain in sales volume even in the present period of lessened general business activity. We expect 1958 to be a good year and if, as we believe, business picks up in the second half of the year, it may be a very good year.

By Order of the Board of Directors

President

Chairman of the Board

[fol. 1843] **3340**

Continental and the Packaging Industry

The concept of a packaging industry is something new. As little as twenty years ago, use of the word "package" as a verb was relatively rare. Products were "packed" in cans, jars, bags or boxes. The people who consumed them had a certain amount of interest in where the product came from, but they took the packaging for granted.

Today most Americans are keenly aware of packaging, and the verb is a part of their everyday language. There is a reason for this change: the function of packaging has become very important to them. Packaging has had a tremendous impact on the economy — and on the way people live. It has been a big factor in the evolution of mass distribution, one of the signal elements of the American way of life.

The packaging industry, in which Continental is the first company to span every important field, is now a distinct part of the economy. Industry sales are more than $10 billion a year. They have increased fivefold since 1939. Part of this growth, of course, represents the effects of inflation and population growth. But actual volume of packages sold has approximately tripled in the past twenty years, while the population has increased by less than one-third. And every indication is that the growth the packaging industry has seen in this period will be greatly exceeded in the next twenty years.

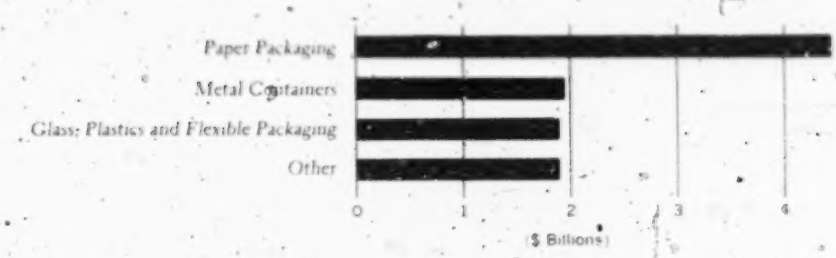
A NEW APPROACH TO PACKAGING

The packaging industry leaped to maturity almost overnight to supply the beachheads of World War II. Never before had packaging in so many complex and specialized forms been so urgently needed. In preceding years there had been a can industry, a glass industry, a paperboard industry, and others concentrating in their own forms of packaging. But for the most part they had never had much incentive to venture across industry lines into other forms of packaging, or to exchange packaging techniques from industry to industry.

The demands of the global war not only created that incentive but made it a powerful stimulus. This developed a pattern of alertness, inventiveness and imaginative approach to packaging problems that provided the base for the packaging industry's tremendous postwar growth. Along with this inter-industry exchange of techniques came major improvements within the industries themselves.

At the war's end the new industry turned its inventive energy to adapting its new capabilities to wide peacetime use. It found an eager market. The feats of industrial productivity that had helped win the war had made possible, in the peacetime economy, a vast advance in the standard of living. Simultaneously,

[fol. 1844] THE TEN-BILLION DOLLAR U. S. PACKAGING INDUSTRY (1957 Sales)



the high level of employment accompanying the higher living standards raised the cost of personal services and thereby created a void which packaging surged to fill.

SELF-SERVICE SELLING

The economies made possible by these new developments in packaging were quickly recognized in industry, agriculture and transportation. But the substitution of packaging services for personal services reached its most dramatic pitch in the supermarket. Its beginnings, of course, antedated the war, for self service grocery stores came into being in the mid-1930's. Its real growth, however, came in the postwar years of rising wage rates and relatively scarce labor. The functions of the package were extended to include not only making self service as easy as possible but merchandising the contents of the package to the shopper. It did this by catching her eye with bright, colorful printed designs, often showing the product in use or ready to serve, and then triggering her recognition by flashing to her the name or trademark.

The magnitude of this shift is in part reflected in the increase in dollar sales volume per employee in the average grocery store. In 1939, when supermarkets were already widely established but packaging was only partially geared to their requirements, the average grocery clerk sold approximately $16,500 worth of merchandise in the course of a year. By 1956, with his functions more and more restricted to stocking the shelves and manning the check out counter, his sales volume had tripled to $49,000 a year. Of course the 1956 dollar didn't buy as many groceries as the pre war dollar, but the actual volume of groceries sold per employee still was up very substantially.

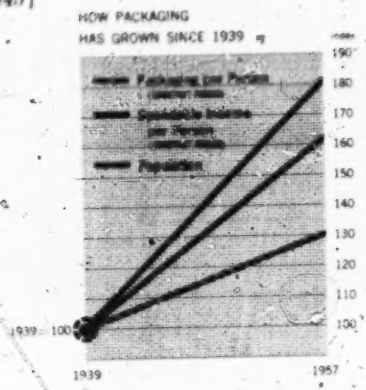
CONVENIENCE PACKAGING IN MODERN LIVING

While the package as a labor saver can be seen most dramatically in the supermarket, its utility to the customer has been an important factor in the growth of the packaging industry since the first mass production of metal cans — and its importance is continuing to grow.

In inverse proportion to the decreasing number of grocery clerks, the number of housewives with outside employment has been steadily growing. According to a recent government report there were 5 million of them in 1940. By 1952 their number had grown to 7.5 million, and in 1957 it was 13 million.

[fol. 1845]

3342



Most Americans today have incomes which entitle them to a living standard that only the well-to-do could afford in pre-war years, even after adjusting for inflation. But because so many of us have shared in this rise of living standards, there are few left to perform the tasks that maids, cooks and other servants performed for the well-off a scant generation ago.

This means the housewife has to do a number of routine but time-consuming things which, in her grandmother's day, would probably have been done for her. However, even though she can't afford a cook or maid, she can easily afford to buy the great variety of hidden services that have been built into almost every packaged product on the market. If she is one of the growing number of part time housewives, accustomed to putting a dollar-and-cent value on her time, she welcomes the opportunity to pay two or three pennies more for a packaged convenience that saves her ten times that outlay in time.

The production line, therefore, has taken a large part of the drudgery out of her life. Thanks to the package, ingredients can be mixed and weighed for her, in exact proportions, by somebody she never sees. They reach her in such form that they need a minimum of processing on her part. By pushing the button on an aerosol can, she can bandage a cut finger, paint a piece of furniture, lubricate the vacuum cleaner or baste a barbecue.

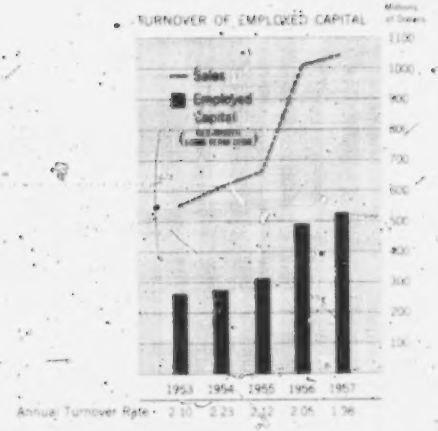
THE RIGHT PACKAGE

This review of what the packaging industry is and what has made it grow provides a frame of reference for Continental's role in the industry.

For every product that is packaged, there is one most suitable package against which other forms of packaging can compete only at a disadvantage. On that premise, Continental by 1957 had become the first company in the industry which could offer every customer the best package for his product, rather than the one or two in which it happened to specialize.

Having attained this objective, Continental will continue to develop new packages as new requirements appear, improve existing forms of packaging, and extend the utility and convenience of packaging to many products which heretofore have not been packaged. These achievements, like Continental's growth and diversification in the past two decades, will benefit its customers, the American consumer, and the national economy as a whole — as well as Continental's stockholders and its employees.

[fol. 1846]



SALES

Net sales of $1,046,267,000 again established a record high in 1957, compared with $1,010,268,000 in 1956. Physical volume, however, was down slightly, so the dollar gain resulted from increases in the prices of our products.

Sales by product groups, expressed in millions of dollars, were divided as follows:

Product Group	1957		1956	
	Total	Per Cent	Total	Per Cent
Metal	$ 561.2	53.6	$ 533.5	52.8
Paper	258.7	24.7	261.2	25.9
Glass and Plastics	165.0	15.8	160.2	15.9
Other	61.4	5.9	55.4	5.4
Total	$1,046.3	100.0	$1,010.3	100.0

EARNINGS

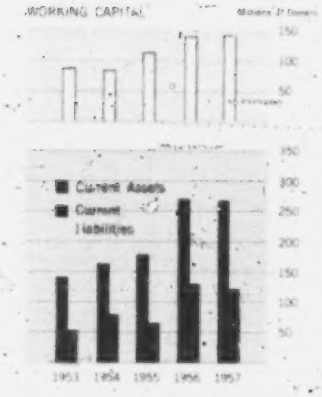
After income taxes and minority interest in income of a subsidiary, net earnings amounted to $41,040,000 or 3.9 per cent on sales. This compared with $43,143,000 or 4.3 per cent on sales in 1956. After preferred dividends, earnings were equivalent to $3.52 per share of Common stock on 11,202,778 shares outstanding, as against $3.71 on 11,174,595 shares in 1956.

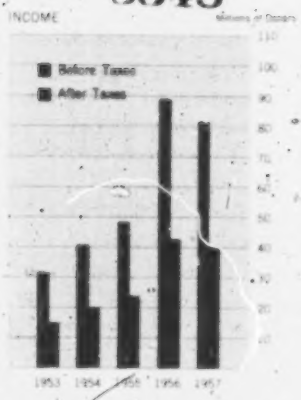
Earnings before income taxes amounted to $81,324,000 in 1957 or 7.8 per cent on sales, compared with $88,861,000 or 8.8 per cent on sales in 1956. This included $2,936,000 of capital gains, realized for the most part through the sale of timberlands in Arkansas which were too distant from any of the Company's kraft mills to be useful as a source of pulpwood. In 1956, capital gains totalled $1,187,000.

PRICES AND COSTS

Profits were squeezed due to rising costs of labor, materials, freight, etc., without compensating price increases. At the same time, most divisions suffered from the slowdown in activity in the last quarter. In the case of metal cans, which represent about half of our sales volume, this decrease was accented by the advance buying in 1956 to beat a price increase of November 1, 1956. A portion of this 1956 sales bulge was borrowed from 1957 sales. An increase in metal can prices, announced for March 10,

[fols 1848]





1958, is expected to help offset some of the increased costs that we have been absorbing since the previous increase of May 1, 1957.

During November, prices of both glass containers and fibre drums were increased to offset higher costs. Also, in February, 1958, recognition of higher costs was reflected in increased prices for crown caps. Higher prices for screw caps, vacuum twist-off and side seal caps have been announced for April 1, 1958.

DEPRECIATION AND DEPLETION

Provisions out of operating income for depreciation and depletion amounted to $26,278,000 in 1957, compared with $23,421,000 in 1956. Accelerated depreciation under approved Necessity Certificates, included in these totals, was $1,207,000 in 1957 and $1,329,000 the year previous.

For tax purposes, but not for book purposes, capital expenditures since January 1, 1954, have been depreciated on "the sum of the years – digits" or "declining balance" methods. For 1957, this reduced income taxes by approximately $2,368,000, of which amount $1,335,000 was set aside in a reserve for deferred income taxes, leaving about $1,033,000 added to net income for the year. In 1956, the corresponding amount added to net income was approximately $1,300,000. We expect to provide a reserve in 1958 for the full amount of any similar tax savings for that year.

DISPOSITION OF EARNINGS

After dividends of $21,739,000 there remained $19,391,000, or 47 per cent of total net earnings, which were reinvested in the business.

In addition to regular dividends on the $3.75 Cumulative Preferred Stock and the Seventh Preferred Stock ($4.50 Cumulative), regular quarterly dividends of $.45 per share were paid on the Common Stock on March 15, June 15, September 14 and December 14.

WORKING CAPITAL

The ratio of current assets to current liabilities on December 31, 1957, was 2.1 to 1, unchanged from that of December 31, 1956. Current assets totalled $267,911,000 and current liabilities $124,845,000. Working capital increased during the year from $139,823,000 to $143,066,000.

In the past two years, Receivables and Inventories increased by over $27 million and Net Fixed Assets by over $87 million. These increases were largely responsible for the increase in short term bank loans and other current liabilities of almost $35 million, long term debt $18 million, and the decline in cash of $20 million during the period.

To replenish our working capital, $20 million was borrowed in December from banks on 4½ per cent notes. Of this amount, $10 million is payable on April 15, 1959, and $10 million on January 16, 1961. This borrowing ties in with our basic program of replenishing working capital from earnings and other internal sources over the next few years.

Also, to supplement our cash flow and to meet the construction costs of a new bleached paperboard mill over the next three years, loans totalling $35 million were arranged last fall through three insurance companies on 5 per cent notes due in 1980, the proceeds to be available in installments of $15 million in April, 1958, $10 million in April, 1959, and $10 million in January, 1960.

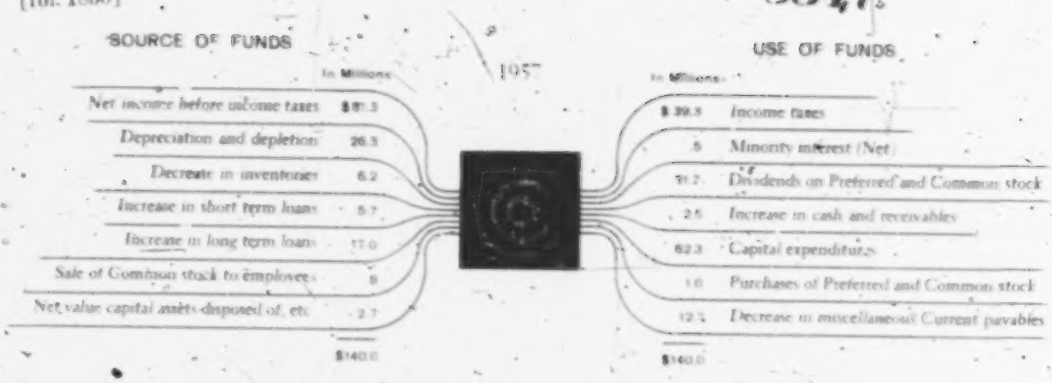
CAPITAL EXPENDITURES

Gross capital expenditures totaled $62,300,000 in 1957 exclusive of amounts expended for land and buildings on "sale and leaseback". In the Metal Operations Group this represented the completion and equipping of new can plants in the Metropolitan New York and Cincinnati areas, the acquisition of a building in Milton, Pennsylvania, which has been equipped as a can plant, the construction of a warehouse in Cuba, the installation of a coil stock line in Chicago, the acquisition of a metal can plant site at Merced, California, and an additional facility at San Leandro, California. The Glass and Plastics Group during the year completed the equipping of a new glass plant in Plainfield, Illinois, installed new and more flexible production equipment in several of the older glass plants, and installed equipment for the manufacture of a new type of twist-off cap for glass containers at the subsidiary White Cap Company in Chicago. The Robert Gair Paper Products Group acquired 66,670 additional acres of timberlands to back up its kraft paper operations in the South, purchased a site for a new corrugated box plant in Tyler, Texas, completed a new folding carton plant at Winnipeg, Manitoba and a corrugated box plant at Cleveland, and completed the installation of a fourth paper machine and auxiliary equipment at the kraft paper mill in Hodge, Louisiana.

EMPLOYEE GROUP INSURANCE AND PENSIONS

All employees and, to some extent, their dependents are covered by comprehensive group insurance programs which provide hospitalization, surgical, health and accident, and life insurance benefits. The net cost of these coverages to Continental for the latest applicable policy year was $8,800,858 compared with $5,813,742 for the previous policy year, prior to the Gair and Hazel Atlas mergers. On December 31, 1957, $436,176,986 of life insurance was in force for 57,965 employees, including $8,727,768 for 1,790 retired employees. During the latest applicable policy years, total claims paid by insurance companies amounted to $8,470,068, of which $2,114,267 represented death claims.

At the end of the year 1,513 retired employees were receiving monthly pensions under the several retirement plans in force, compared with 1,172 a year previous. During 1957, $8,738,660 was contributed to the pension fund for United States employees, compared with $6,131,464 for the previous year, and $623,240 (Canadian) for Canadian employees, compared with $680,578 for the previous year.



OUR SHAREHOLDERS

On December 31, 1957, there were 1,207 holders of record of the outstanding 147,000 shares of $3.75 Cumulative Preferred stock, 2,392 holders of the outstanding 232,818 shares of Second Preferred stock and 53,127 holders of the outstanding 11,202,778 shares of Common stock, of which 26.4 shares are represented by fractional scrip certificates.

On November 22, 1957, the record date of the 1957 Common dividend, the Common shares were distributed as follows:

Shares Held by	No. of Holders	%	Shares Held	%	Average No. Shares Per Holder
Male	18,936	33.7	2,405,228	20.6	126
Female	21,164	40.0	2,169,683	19.3	102
Joint Tenants	7,561	14.3	445,707	4.0	59
Fiduciaries	3,190	6.0	1,049,941	9.4	328
Brokers	250	.5	861,170	7.7	3,445
Nominees	706	1.3	3,350,801	29.9	4,746
Institutions and Foundations	493	.9	246,335	2.2	500
Corporations, Insurance Companies, Investment Trusts, etc.	692	1.3	773,366	6.9	1,118
Total	52,992	100.0	11,202,231	100.0	

Of the total number of shareholders shown in the table above, 454 holding 84,078 shares were located in foreign countries; 7,495 or 14% held 10 shares or less, and 11,426 or 22% owned over 100 shares each.

Notes to Financial Statements

NOTE 1 GENERAL

During 1956, the Company acquired, on a merger basis, all the outstanding stock of White Cap Company and the net assets of Hazel Atlas Glass Company and Robert Gair Company, Inc. The accompanying statements of income and earnings retained in the business include the results of operations of the merged companies for the entire year 1956. Certain 1956 expenses have been restated for comparability with 1957. Earnings per share are expressed in terms of the number of shares outstanding at the respective year-ends.

NOTE 2 INVENTORIES

Inventories are stated at the lower of cost or market. Cost for this purpose represents standard, average, or actual cost with respect to approximately 79% of the 1957 inventory (77% in 1956) and "last in, first out" (LIFO) cost-and-the remaining 21% (23% in 1956).

NOTE 3 INVESTMENTS

Investments are stated at cost, which is less than value based on market quotations.

NOTE 4 LONG TERM DEBT

Long Term Debt comprises the following:

	In Thousands of Dollars	
	DECEMBER 31, 1957	DECEMBER 31, 1956
3% promissory note due May 25, 1961	$ 4,966	$ 2,993

4½% promissory notes due January 16, 1961	10,000	—
	$133,328	$116,346

The terms of the notes and indentures require the Company to apply toward retirement of the principal of the indebtedness not less than approximately $1,800,000 per annum during the years 1958 through 1962 in addition to repaying the promissory notes due in 1959 and 1961. The principal covenants and restrictions under the notes and indentures were amended in 1957 to make them consistent with each other. See also "Working Capital" in the text of this Annual Report for a description of arrangements for future borrowings.

NOTE 5 COMMON STOCK

At December 31, 1957, 558,764 shares of the authorized but unissued Common Stock were reserved for conversion of the Second Preferred Stock (at the rate of 2.4 shares of Common for each share of Second Preferred). In addition, 383,185 shares of Common Stock (either unissued or treasury shares) are reserved for sale under employees stock option plans or for deferred compensation requirements.

NOTE 6 CAPITAL SURPLUS

Capital surplus increased in 1957 by $466,285, arising principally from excess of consideration received over the par value of Common Stock sold under employees' stock purchase plans and from excess of par value of Second Preferred Stock converted during the year over par value of Common Stock issued in exchange therefor.

[fol. 1856]

7

NOTE 7 EARNINGS RETAINED IN THE BUSINESS

The Company's Certificate of Incorporation and various promissory notes and indentures limit the amount which may be expended for the payments of cash dividends and the purchase, redemption or retirement of the Company's capital stock. At December 31, 1957, under the terms of the most restrictive of these documents, the Company may not apply more than $40,000,000 to such purposes.

NOTE 8. STOCK OPTION PLANS

The Company has two plans for the issuance to employees of options to buy its Common Stock at prices from 90 per cent to 95 per cent of the market value when the options were issued. On June 12, 1957, 343,250 shares of stock were offered employees under Plan 1 at an option price of $42 per share. Of 50,020 employees eligible, 12,671 submitted elections to purchase a total of 142,260 shares, and on December 31, 5,341 shares had been paid for in full and delivered under the June 1957 offering. Plan 1 will end when all of the shares have been purchased, or on June 19, 1961, whichever is earlier. On May 14, 1957, options to purchase 52,775 shares at a price of $45 per share were granted to 50 employees under Plan 2. During the year, a total of 14,227 shares of the authorized but unissued stock was sold to 70 employees upon exercise of purchase options under this plan. At December 31, 1957, 170 members of management held options to purchase a total of 246,855 shares of Common Stock at prices ranging from $17.63 a share for those granted in June 1951 to $45.00 a share for those granted in May 1957. All these options are exercisable in equal annual installments from the date granted and expire on June 21, 1961.

NOTE 9 ANTI-TRUST SUITS

Two anti-trust suits brought against the Company in 1956 by the Department of Justice claiming violation of the Clayton Act in connection with the mergers into the Company of the Hazel Atlas Glass Company and the Robert Gair Company, Inc. are still pending. The Company has filed answers denying the material allegations of the complaints.

NOTE 10 MISCELLANEOUS

Reference is made to the indicated sections of the text of this Annual Report for information as to: Capital Program, pages 4 and 16; Federal Income Taxes, page 15; "Depreciation and Depletion", Non-recurring Capital Gain, page 14 ("Earnings"), and Employees Group Insurance and Pensions, page 16.

Auditors' Report

To The Board of Directors and Shareholders,
Continental Can Company, Inc.:

We have examined the consolidated balance sheet of Continental Can Company, Inc. and its subsidiary companies as of December 31, 1957 and the related statements of consolidated income and earnings retained in the business for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying consolidated balance sheet and statements of consolidated income and earnings retained in the business present fairly the consolidated financial position of the companies at December 31, 1957 and the consolidated results of their operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

[fol. 1864] DEFENDANT'S EXHIBIT J

IN THE DISTRICT COURT OF THE UNITED STATES FOR THE WESTERN DISTRICT OF PENNSYLVANIA

In Proceedings for the Reorganization of a corporation

No. 21680

In the Matter of:
NEVILLE ISLAND GLASS COMPANY, INC. Debtor

PETITION OF DISTINTERESTED TRUSTEE FOR DIRECTION AS TO FORM AND MANNER OF SUBMISSION OF TRUSTEE'S REPORT AND STATEMENT UNDER SECTION 167 (5) OF CHAPTER X OF THE BANKRUPTCY ACT AND RELATED MATTERS.

(Trustees' Petition No. 8)

To the Honorable The Judges of Said Court:—

The petition of Joseph H. Bialas respectfully represents:

First: On March 1, 1948 petitioner was appointed as the disinterested trustee in this matter and at the same time R. M. Marshall was appointed as the operating trustee. Said trustees duly qualified and have been acting in such capacity.

Second: Thereafter on March 15, 1948 petitioner and the co-trustee reported pursuant to Section 167 (1) of Chapter X of the Bankruptcy Act, recommending discontinuance of operations for the reasons set forth and, order of court was entered accordingingly.

Third: Pursuant to Section 167 (5) of said Act (11 USCA 567), petitioner has prepared in detail "report and statement of trustee" reflecting his investigation of the property, liabilities and financial condition of the debtor, the de-[fol. 1865] sirability of the continuance thereof and causes of action available to the debtor. As stated therein (p. 22) the final preparation thereof for submission was contingent upon the outcome of matters pending with Hartford Empire Company which were finally adjudicated by decree entered on September 10, 1948.

Fourth: Petitioner submits herewith said "report and statement of trustee" having attached thereto as Exhibit

"A" report of auditors as made to the trustees and as Exhibit "B" statement of cash transactions by the trustees. Request is made that your Honorable Court approve said report as to form and substance and order that the same be filed as part of the record herein.

Fifth: Petitioner requests authorization to have said "report and statement of trustee" printed and then direction that in such printed form said "report and statement of trustee" be sent by ordinary mail to all creditors and stockholders of debtor, to the Colonial Trust Company of Pittsburgh, Pa. as indenture trustee, to the Securities and Exchange Commission, to Frank W. Stonecipher, Esq. record counsel for the Protective Committee for Unsecured Creditors and to Messrs. Koontz, Fry, Staley & Meyer, counsel of record for certain stockholders, each said printed copy to contain on the first cover page notice in the following form.

Notice

To the creditors and stockholders, indenture trustee, the Securities and Exchange Commission and other persons interested in the matter of Neville Island Glass Company, Inc. debtor.

[fol. 1866] Notice is hereby given that the creditors and stockholders of Neville Island Glass Company, Inc., the above named debtor, may submit to me at my office, 2610 Grant Building, Pittsburgh 19, Pa., on or before December 1, 1948 suggestions for the formulation of a plan for the reorganization of the debtor or proposals relative to the form of plan for the reorganization of the debtor.

Joseph H. Bialas, Trustee.

T. F. Ryan, Attorney for Trustees, 2610 Grant Building, Pittsburgh 19, Pa.

Dated at Pittsburgh, Pa., November, — 1948".

Sixth: Relative to said report of auditor's attached as Exhibit "A" to the foregoing "report and statement of trustee" petitioner represents that printing of the extensive notes and schedules forming part thereof would serve

to make the cost of such printing excessive if not prohibitive and that in said "report and statement of trustee" petitioner calls attention to this situation and to the fact that the original of the auditor's report is of record and open for inspection. Furthermore it is believed that considerable of the data contained in said notes and schedules has been already summarized by petitioner in the "report and statement of trustee". Therefore petitioner believes it proper and advisable to print only the following portions of said auditor's report, viz;

	Page
Certificate	1
Exhibit "A" balance sheet March 1, 1948	2
Exhibit "B" statement of income, profit and loss year ending December 31, 1947 and period January 1 to March 1, 1948	3
[fol. 1867]	
Exhibit "C" statement of earned surplus deficit, statement of paid in surplus March 1, 1948	4
Note B at page 5, last two paragraphs without accompanying table;	
Note C on page 6, except second sentence of first paragraph, reference to note J in third paragraph, entire fourth paragraph and reference to note 1 in fifth paragraph;	
Note E starting at page 6, first three sentences of first paragraph and last two sentences of second paragraph;	
Note F (without the accompanying table) commencing on page 8 with the exception of the seventh and eighth paragraphs thereof;	
Note P on page 15, first paragraph including subdivisions (a) to (f);	
Schedule No. 4	39
Schedule No. 5	40
Schedule No. 6	41
Schedule No. 7	42
Schedule No. 10	45

Therefore petitioner submits all the foregoing to your Honorable Court and prays for due authority and direction in the premises. Furthermore petitioner prays that your Honorable Court fix December 1, 1948 as the date by which time parties in interest shall submit to petitioner suggestions for reorganization and also that your Honorable Court fix the date by which time petitioner shall file a plan of reorganization.

Joseph H. Bialas.

[fol. 1868] Commonwealth of Pennsylvania
County of Allegheny, ss:

Before me, a Notary Public in and for said County and Commonwealth, personally appeared Joseph H. Bialas, petitioner herein, who being duly sworn according to law, deposes and says that the allegations contained in the foregoing petition are true and correct as he verily believes.

Joseph H. Bialas.

Sworn to and subscribed before me this 3rd day of November 1958.

Vera Skelley, Notary Public.
My commission expires, March 11, 1949.

[fol. 1869] Order of Court

And now, to-wit, this 4th day of November 1948 the within petition presented in open court and upon consideration thereof it is hereby ordered, adjudged and declared as follows:

1. The "report and statement of trustee" attached to the foregoing petition as Exhibit No. 1 be and the same is hereby approved as to form and substance and the same is ordered to be filed so as to become part of the record herein.

2. As an administration cost in this proceeding said report shall be printed, including the portions of the auditor's report attached thereto as Exhibit "A" which are indicated in the within petition together with statement attached to the "report and statement of trustee" as Exhibit "B", and such printed copy thereof shall be sent by ordinary mail to

each creditor and stockholder of debtor as appearing on its books and records; to Colonial Trust Company of Pittsburgh, indenture trustee; to the Securities and Exchange Commission; to Frank W. Stonecipher, Esq., counsel of record for Protective Committee for Unsecured Creditors; and to Messrs. Kountz, Fry, Staley and Meyer, counsel of record for certain stockholders.

3. December 1, 1948 is fixed as the last date by which bondholders, creditors, stockholders and other parties in interest may mail to the disinterested trustee suggestions for a plan of reorganization or proposals relative thereto, same to be in typewritten form and the first cover page of such printed copy of the "report and statement of trustee" [fol. 1870] shall contain notice addressed and in the form as indicated in the within petition relative to submission of suggestions for the formulation of a plan of reorganization of the debtor.

4. Proof of mailing shall be filed of record not later than December 1, 1948.

5. The trustees shall file a plan of reorganization on or before December 31, 1948.

6. Copy of this order of court shall in printed form be sent to each party in interest with the printed copy of the "report and statement of trustee" under Section 167(5) of Chapter X of the Bankruptcy Act.

R. M. Gibson, D.J.

[fol. 1871] IN THE DISTRICT COURT OF THE UNITED STATES FOR THE WESTERN DISTRICT OF PENNSYLVANIA

In Proceedings for the Reorganization of a corporation

No. 21680

In the Matter of NEVILLE ISLAND GLASS COMPANY, INC., Debtor

Report and Statement of Trustee

(Pursuant to Section 167 of Chapter X of the Bankruptcy Act)

Introduction

By decree entered on March 1, 1948 the Honorable Robert M. Gibson, Judge of the District Court of the United States for the Western District of Pennsylvania, approved the voluntary petition of Neville Island Glass Company, Inc. (hereinafter some times referred to as "Company" or "debtor") for reorganization pursuant to Chapter X of the Bankruptcy Act and thereupon appointed Joseph H. Bialas as disinterested trustee and R. M. Marshall as operating trustee. This report is submitted by said disinterested trustee under and in accordance with Section 167 of that Act for the purpose of informing the Court and all parties in interest relative to the property, liabilities and financial condition of the debtor, the operation of its business, available causes of action and other information upon the basis of all of which a plan of reorganization may be susceptible of formulation.

Formation of Debtor

Walkerman D. Dugan, who became president and director of the Company, originally conceived the idea of locating a new glass-container manufacturing plant in the Pittsburgh area, the basis being such claimed attractions as potential [fol. 1872] volume of business, proximity of sources of supply and abundance of skilled labor. His first association with

this industry was as a certified public accountant and later he became active in an executive capacity as president of Olean Glass Company, Olean, N. Y., of which City he became mayor.

His first approach was to New York underwriters in 1945 relative to plans for financing such a company. Also he consulted Frazier-Simplex Inc. of Washington, Pa., engineers of national repute in the design and construction of glass plants, and in the course of discussion plant site and construction costs were estimated at about $1,000,000.00. Frazier-Simplex Inc. put Mr. Dugan in touch with Pittsburgh Coke & Chemical Company on Neville Island which was desirous of having such a glass plant nearby to use its by-product gas as an available source of unfailing fuel supply.

The plan for financing the Company finally proposed by the underwriters called for the issuance of $700,000.00 in first mortgage bonds and a like amount in stock. Pittsburgh Coke & Chemical Company indicated its willingness to take the bonds if the Company would purchase an adjoining tract on Neville Island as the site of its plant to use said gas and provided that Mr. Dugan was successful in having the underwriters take the stock.

On the basis of such understandings the Company was incorporated on February 14, 1946 under the laws of Pennsylvania to engage in the business of manufacturing glass containers and glass products generally.

[fol. 1873] The articles of incorporation list the first directors of the Company as being

Walkerman D. Dugan	(who became president)
Charles D. Franchot	(of counsel for Company)
Allan L. Melhado	(with one of the underwriters)
Richard M. Marshall	(One of the trustees here and president and director of Pittsburgh Coke & Chemical Company).
Ralph C. Baker	(with one of the underwriters)

On March 16, 1946 Mr. T. W. Kirkpatrick (secretary and director of the Pittsburgh Coke & Chemical Company) was elected a director. On June 17, 1946 Mr. John J. Connell

(with one of the underwriters) was elected a director. On June 19, 1947 Mr. H. R. Mustard (treasurer and director of Pittsburgh Coke & Chemical Company) was elected vice-president in charge of finance.

Due action was taken to confirm the above recited preliminary arrangements and to authorize the bond and stock issues. A tract of 5.216 acres on Neville Island adjoining the plant of Pittsburgh Coke & Chemical Company was acquired from the latter at $5,000.00 per acre or $26,080.00. Pittsburgh & Ohio Valley Railroad Company (a wholly owned subsidiary of Pittsburgh Coke & Chemical Company) extended its tracks to the property line and the Company paid $12,200.00 for construction of railroad siding on its own land.

Registration statement was filed with the Securities and Exchange Commission on June 3, 1946 and the prospectus made puble offering of the stock issues. Those documents indicated the speculative nature of this enterprise.

[fol. 1874] Capitalization of Debtor

Under the articles of incorporation and amendments thereto or by corporate action duly taken capital issues were authorized as follows:

Class A Stock—70,000 shares of the par value of $1.00 each, entitled to dividends of 60 cents per annum payable quarterly—annually cumulative from January 1, 1948 (and prior thereto net profits permitting) with provision that one thereof is exchangeable for two shares of common stock, that each class A share is redeemable on call at $11.00 and that each thereof is entitled to $10.00 in dissolution or other liquidation. Although originally without vote each share of class A stock was later given one vote with the further provision that if cumulative dividends should remain unpaid for eight consecutive quarters the holders thereof as a class have the right to elect two directors of the Company.

Common Stock—600,000 increased to 920,000 shares of the par value of 10 cents per share, each entitled to one vote, to dividends after payment of all accumulations on the class A stock and to share in dissolution

or other liquidation only after holders of class A stock have received $10.00 per share as aforesaid and accumulated dividends.

Bonds—By trust indenture of mortgage dated April 1, 1946 but acknowledged and recorded on May 29, 1946 in mortgage book vol. 2802, page 30, to Colonial Trust Company as trustee, bonds to the total of $1,200,000.00 [fol. 1875] face amount were authorized to be issued in series from time to time. The initial issue was $500,000.00 face amount of class A bonds (non-convertible) and $200,000.00 face amount of class B bonds (convertible). Attached to said recorded mortgage indenture is part of an agreement dated May 29, 1946 with Pittsburgh Coke & Chemical Company whereby the latter agreed to buy said initial issue on or before August 1, 1946 provided that $437,460.00 received from sales of class A and common stock together with $700,000.00 of bond proceeds be deposited with the trustee as plant construction fund. First supplement to said mortgage indenture is dated June 25, 1947 which was acknowledged and recorded the same day in mortgage book vol. 5882, page 8, reciting that plant construction costs have exceeded estimates and providing for $250,000.00 face amount of series C bonds to be dated June 25, 1947 and to mature September 25, 1947. Second supplement to said mortgage indenture is dated August 1, 1947 which was acknowledged and recorded on August 2, 1947 in mortgage book vol. 2904, page 6, providing for $500,000.00 face amount of series D bonds to be dated August 1, 1947, the purpose thereof being to redeem series C bonds and to pay construction costs remaining in the amount of $211,812.16.

[fol. 1876] Disposition of Capital Issues

The Company sold to underwriters 60,000 shares of class A stock and 60,000 shares of common stock for public offering in units of one share of class A stock and one share of common stock at $10.10 per unit which was done in August 1946. The discount to underwriters was $1.50 per unit, resulting in net proceeds of $8.60 per unit to the Company or a total of $516,000.00 with a cost to the public of $606,000.00.

In April 1946 sales were made to Walkerman D. Dugan, president and director of the Company, totalling 10,000 shares of class A stock and 10,000 shares of common stock on the basis of $8.60 per unit (the same net as above), thus proucing $86,000.00. In addition there were sales of common stock to him and to underwriters to the extent of 270,000 shares at the par value of 10 cents each or $27,000.00. On September 3, 1947 the Company sold to Pittsburgh Coke & Chemical Company 320,000 shares of common stock at the par value of 10 cents per share of $32,000.00.

Thus 70,000 shares of class A and 660,000 shares of common stock were issued and the net proceeds of sales thereof amounted to $661,000.00 ($602,000.00 for 70,000 units at $8.60 per unit and $59,000.00 for 590,000 shares of common at 10 cents each). There were reserved 260,000 shares of common stock to meet the conversion privileges of 70,000 shares of class A stock and of $200,000.00 of class B bonds (hereinafter stated).

Schedule of said net proceeds from sale of capital stock is as follows:

[fol. 1877]

	April 1946			
Class A	W. D. Dugan	10,000 Shs.	$ 85,000.00	$ 85,000.00
Common	W. D. Dugan	160,000 Shs.	16,000.00	
	A. L. Melhado	30,000 Shs.	3,000.00	
	C. P. Franchot	20,000 Shs.	2,000.00	
	W. B. Dessner	10,000 Shs.	1,000.00	
	C. G. Wray	12,000 Shs.	1,200.00	
	Amott, Baker & Company	32,000 Shs.	3,200.00	
	Buckley Bros.	8,000 Shs.	800.00	
	Herrick, Waddell & Company, Inc.	8,000 Shs.	800.00	28,000.00
				$113,000.00
	August 1946			
Class A	Amott, Baker & Company	20,000 Shs.	$170,000.00	
	Buckley Bros.	20,000 Shs.	170,000.00	
	Herrick, Waddell & Company, Inc.	20,000 Shs.	170,000.00	
			510,000.00	
Common	Amott, Baker & Company	20,000 Shs.	$ 2,000.00	
	Buckley Bros.	20,000 Shs.	2,000.00	
	Herrick, Waddell & Company, Inc.	20,000 Shs.	2,000.00	
			6,000.00	$516,000.00
	September 3, 1947			
Common	Pittsburgh Coke & Chemical Company	320,000 Shs.	$ 32,000.00	32,000.00
				$661,000.00

The authorized funded indebtedness was divided into $1,000,000.00 first mortgage 4½ percent non-convertible bonds (due April 1, 1956) and $200,000.00 first mortgage 4½ percent bonds (due April 1, 1956) convertible into 120,000 shares of common stock. On August 13, 1946 the Company sold to Pittsburgh Coke & Chemical Company $500,000.00 of Series A bonds and $200,000.00 of Series B bonds for $700,000.00 cash plus interest accrued thereon after April 1, 1946. The initial proceeds to the Company from stock and bond sales thus were as follows:

[fol. 1878]

Proceeds from sale of stocks to promoters	$ 113,000.00
Proceeds from sale of stocks to public (not including September 3, 1947 sale to Pittsburgh Coke & Chemical Company for $32,000.00)	516,000.00
Proceeds from sale of bonds	700,000.00
Total	$1,329,000.00

The proposed application of the foregoing proceeds as shown on the Prospectus was as follows:

Estimated cost of plant	$1,163,540.00
Estimated organization expenses	36,000.00
Estimated interest and salaries prior to operation	25,250.00
Balance for working capital	105,210.00
Total	$1,329,000.00

The Company later sold to Pittsburgh Coke & Chemical Company $250,000.00 of Series C bonds at par on June 24, 1947 and on September 3, 1947 sold to the same purchaser $500,000.00 of Series D bonds at 90 or $450,000.00, retiring the $250,000.00 of Series C bonds out of said proceeds.

Upon acquisition of plant site and commencement of plant construction the relative voting power and equity investments appeared to be as follows:

	Before Conversion		After Conversion		Cash Equity Investment	
	Votes	%	Votes	%	Amount	%
Promoter group	290,000	71	300,000	50	$113,000	12
Pittsburgh Coke & Chemical Company	—	—	120,000	20	200,000	22
Public	120,000	29	180,000	30	606,000	66
	410,000	100	600,000	100	919,000	100

After sale of 320,000 shares of common stock to Pittsburgh Coke & Chemical Company on September 3, 1947 the foregoing table reflected the following:

[fol. 1879]

	Before Conversion Votes	%	After Conversion Votes	%	Cash Equity Investment Amount	%
Promoter group	290,000	40	300,000	33	$113,000	12
Pittsburgh Coke & Chemical Company	320,000	44	440,000	48	232,000	24
Public	120,000	16	180,000	19	606,000	64
	730,000	100	920,000	100	$951,000	100

Assets of Debtor

The books show that for $26,080.00 the Company purchased from Pittsburgh Coke & Chemical Company a tract of land on Neville Island in addition to which it deposited the sum of $1,137,460.00 with Colonial Trust Company, the mortgage indenture trustee, for disbursement on engineers' certificates covering construction of plant estimated to cost with land and site improvements the amount of $1,163,540.00. However final construction costs including purchase of molds, the installation of equipment and other items amounted to considerably more than the above estimate.

The plant is erected on a rectangular—U—shaped tract of land consisting of slightly more than five acres on Neville Island with railroad siding and with access to paved road at each horn of the U. Enclosed within said horns is a tract of over three acres abutting on the paved road, which lot debtor has the option to purchase at $16,985.00 within ten years from the date the plant is placed in operation and upon which debtor erected a one-story concrete block building used by it for offices. The plant building is steel clad on solid concrete foundation and houses (1) a single furnace or tank of brick construction for the production of molten glass, (2) bins or silos for raw materials, (3) system or [fol. 1880] equipment for transfer of raw materials to furnace, (4) large air compressor unit, (5) six production [illegible] (6) mold shop with molds, tools, etc. and [illegible] space for storing cartons and finished prod[illegible]

Debtor's books reflect the construction costs at [illegible] 899.70 as an opening asset entry.

All equipment comprising the six production lines (six each of feeders, forming machines, lehrs and stackers with auxiliary equipment) is owned by Hartford Empire Company under patents and debtor had entered into lease-license agreements with said patent owner on the basis of payment of license fees and certain production or minimum royalties. The license fees paid in cash by debtor amounted to $161,000.00 in addition to which installation and engineering costs increased the investment of debtor therein to $255,948.42 as an asset value on its books included in the total plant cost aforesaid.

Said plant has a capacity of about 150 tons daily production of finished ware. One criticism of the plant layout is that the warehouse space and facilities are inadequate which resulted because of insufficient funds to extend warehouse construction as originally planned on land owned and available therefor. Once the furnace is started, operations must be continuous around the clock with three shifts of personnel. Thus considerable warehouse space is required for storage of finished ware for periodic shipments to customers and economy of operation demands the longest possible runs on one type of product into storage so as to obviate expensive delays incident to mold changes.

[fol. 1881] On March 1, 1948 the books of debtor reflected current assets totalling $322,724.81 made up of cash, accounts receivable and inventories. All assets as carried on the books at the total of $2,146,134.14 are shown in detail by report of auditors attached hereto and made part hereof as Exhibit "A". Extensive notes, schedules and analyses accompany said report as filed of record in this proceeding with the original hereof which are open for any inspection but all thereof are not printed to save excessive cost. (The trustees were authorized by the Court in the interest of considerable savings to employ as auditor D. G. Sisterton & Company of Pittsburgh, Pa., who had acted in such capacity for debtor and who had made substantial audit of its affairs to December 31, 1947. D. G. Sisterton & Company act as tax advisers for Pittsburgh Coke & Chemical Company).

Liabilities of Debtor

Bonds in the face amount of $1,200,000.00 are secured by trust indenture of mortgage to Colonial Trust Company trustee, dated April 1, 1946, which recorded encumbrance constitutes a first lien on the land, plant and equipment. All outstanding bonds are held by Pittsburgh Coke & Chemical Company as aforesaid.

Notes payable to Pittsburgh Coke & Chemical Company as of March 1, 1948 were in the net amount of $73,828.18. These notes are secured by assignments of trade accounts receivable under the following arrangements.

On May 14, 1947 the Company borrowed $50,000.00 from Pittsburgh Coke & Chemical Company upon the basis of assignment of specific accounts receivable. This [fol. 1882] was later changed to a revolving collateral fund, so that when payment of a pledged account was received by Pittsburgh Coke & Chemical Company it advanced a like amount to Neville Island Glass Company Inc. upon receipt of an additional assigned account or accounts receivable. In this way the total amount of said loan was increased by $11,653.79 cash advanced against customer's checks which were later returned "unpaid".

Commencing February 1, 1948 a new arrangement was entered into whereby the revolving collateral fund was discontinued and the Company immediately discounted current invoices by assigning and pledging the same to Pittsburgh Coke & Chemical Company for cash advances equal to approximately eighty percent of the face amount thereof, each advance being evidenced by demand note.

In regard to all the foregoing assignments it would appear that there was adequate compliance with the Pennsylvania Act of July 31, 1941 P.L. 606 (69 Purdon's Statutes sec. 561) by making due entry of each thereof on the books and records of debtor. Duplicate original of each invoice contained stamped notation of assignment and was furnished to the assignee; indication of such assignment was stamped on the retained office copy of invoice; and appropriate notation of assign-

ments was stamped opposite respective invoice numbers on the accounts receivable ledger.

[fol. 1883] During February 1948 payments were received on account of assignments in the revolving collateral fund whereby the indebtedness thereunder was reduced to $6788.83. Under said arrangement for discounting invoices the advances during the month of February 1948 totalled $122,300.00 and as each assigned invoice was paid, Pittsburgh Coke & Chemical Company made application to the respective note and remitted the balance to the Company, thus reducing said indebtedness to $67,039.36.

In addition to the foregoing the books of debtor show that Pittsburgh Coke & Chemical Company made unsecured cash advances totalling $190,791.47 including $9,591.47 for freight bills due Pittsburgh & Ohio Railroad Company, a subsidiary of Pittsburgh Coke & Chemical Company, as follows:

Date	Amount
Sept. 24, 1947	$ 25,000.00
Oct. 21, 1947	29,200.00
Nov. 12, 1947	6,000.00
Nov. 19, 1947	15,000.00
Dec. 3, 1947	30,000.00
Dec. 12, 1947	7,000.00
Dec. 22, 1947	15,000.00
Dec. 24, 1947	10,000.00
Jan. 19, 1948	17,500.00
Jan. 21, 1948	6,500.00
Jan. 27, 1948	10,000.00
Jan. 30, 1948	10,000.00
Feb. 29, 1948	9,591.47
	$190,791.47

Also there is due it and subsidiaries the sum of $195,141.38 on open account as follows:

[fol. 1884]

Company	Description		Amount
Neville Concrete Pipe Company	Concrete Block	—	$ 1,756.38
Pittsburgh Coke & Chemical Company	Gas	$182,872.60	
	Electric power and water	3,386.65	
	Miscellaneous materials and services	6,608.40	
			192,867.65
Pittsburgh & Ohio Valley Railway Company	Demurrage, etc.	—	517.35
			$195,141.38

Trade accounts payable in the total amount of $354,704.37 represent chiefly raw materials, supplies, services, royalties and other items (to Hartford Empire Company), balances due on contracts relative to erection of building and installations therein and a substantial amount of carton materials. All of them are unsecured items with the possible exception of two mechanics liens totalling about $2,500.00. Income taxes withheld from employees but unremitted, payroll taxes and accrued real estate taxes are indicated as being liens or preferential items.

[fol. 1885] Business of Debtor

There was considerable expansion in the glass-container manufacturing industry following outbreak of the European war in 1939. After the United States became involved such expansion grew tremendously and continued after cessation of hostilities. Production during 1946 was almost three times that of 1938. To a great extent this was caused by priorities on tin for other uses, thus relegating consumers thereof to glass containers. It would appear that the Company was conceived in an era of tremendous expansion of this industry which continued through 1946 into the first quarter of 1947.

Plant construction and installation of equipment and machinery progressed to such a point that on March 31, 1947 the furnace was lit and operations were started. As a newcomer the Company was confronted with keen competition and its products had to meet severe tests before acceptance thereof under possible contracts therefor. Considerable business tentatively in prospect did not materialize. For a short period the price structure in this industry remained firm and demand continued good. After four or five weeks there were sharp declines in price but nevertheless demand fell off considerably (for example, finished ware of a particular size selling at say $10.00 a gross later commanded only $3.00 to $4.00 per gross).

Examination of the books and records of debtor indicates an amazing amount of overtime throughout its payrolls. Among the reasons advanced are that plant employees were "green", that there was almost constantly a large labor turnover, that inspection was inefficient which resulted in the packing and shipping of bad product and that inade-

[fol. 1886] quate warehouse storage facilities led to considerable rehandling and repacking.

The majority of sales were to distributors at a discount under the market price. Some of these distributors had made cash advances (as hereinafter mentioned) against future supply to them of finished product. Overshipments to these and other customers set up artificial accounts receivable and resulted in losses due to storage charges and forced sales.

As of June 10, 1947 a report was made to Pittsburgh Coke & Chemical Company by Arthur W. Schmid & Company, Pittsburgh, Pa., engineers in the design and operation of glass plants. The express purpose of said report was to estimate "the possibilities and amount of profit that might reasonably be expected from future operations" of the Company's plant. In attempting to forecast the commercial possibilities of said plant the report analyzes cost of raw materials and of operations. There is indication that construction of the plant was in the face of many adverse conditions of material and labor supply with the result that the premium for obtaining the various items in order to complete the plant is estimated at $200,000.00, in addition to which there was a substantial rise in prices during the period of construction. It is pointed out that the Company has a reliable year around supply of fuel in the by-product gas of Pittsburgh Coke & Chemical Company and that the additional capital investment required for installation of gas equipment is balanced by the overall cost of said fuel. There were no predictions as to future sales or prices and the report concludes with the statement "that the Company has a modern well located plant and a capable manufacturing and sales staff; and should prove to be a profitable enterprise".

[fol. 1887] Increased construction costs left the Company without adequate working capital. Competition forced it to accept business in less desirable and less profitable lines. Production and overhead costs exceeded the market price of finished ware. Operations resulted in losses each month averaging $60,000.00 to $70,000.00 during the eleven months of actual operation prior to March 1, 1948. These conditions broadly indicate some of the reasons for this proceeding.

Various Problems

Discontinuance of Operations—Immediately upon their appointment the trustees made thorough inquiry and investigation into the assets and affairs of the Company particularly with a view to deciding upon continuance of operations. As a first precaution notice of layoff was given to all employees with the exception of the office force and a few key personnel in the plant. To date no upward trend of price or demand has occurred in this industry to warrant any change in that conclusion. A study of market prices against production costs served to convince the trustees that continuance of operations pointed to certainty of substantial losses. Upon the basis of available data it appeared that production of one ton of finished ware would cost in excess of $70.00 against an apparent selling price averaging only about $55.00 to $60.00 per ton. Therefore the trustees concluded that it was most inadvisable to continue operations and so recommended to the Court in record submission accordingly, upon which an order was entered approving the recommendation of the trustees. Suppliers of materials on current order were notified to discontinue shipments forthwith.

[fol. 1888] The plant was closed down and watchmen were employed to guard the plant twenty-four hours daily as required by the insurance policies. Office personnel were continued for some weeks during which time the trustees put forth efforts to collect accounts receivable and to liquidate assets for which any market was available. During this period the books and records of debtor were examined by accountants for the trustees pursuant to order of court and were also examined by accountants representing the Committee for Unsecured Creditors as well as by representatives of the Securities and Exchange Commission. Presently the trustees have in their employ only the watchmen aforesaid with the exception of Mr. John W. Adams, bookkeeper of debtor, whose services are required occasionally.

Wages—On February 28, 1948 the Company issued checks covering payroll for the period ending February 21, 1948 and in advance thereof the Company had transferred to payroll account funds to meet said checks. However prac-

tically none of these checks had cleared at bank on March 1, 1948 and immediately upon their appointment the trustees became legally vested with all funds and property rights of debtor by reason of which the bank could not honor said payroll checks. The result was considerable hardship and embarrassment to the employees whose commitments for daily living expenses were based upon receipt of wages. Inasmuch as wages earned within three months constitute a preference under the law and in consequence of many frantic pleas to them the trustees presented that entire situation to the Court and decree was entered authorizing and directing the trustees to make payment of wages constituting legal preferences including wages earned and accrued from Feb-
[fol. 1889] ruary 21, 1948 to March 1, 1948, whereby the trustees paid out a total of $24,173.34. Of course salaries to officers were not included nor were commission accounts to salesmen although the latter may be items for preferential consideration.

Lease-License Equipment—Debtor installed in its plant six production lines consisting of equipment for automatic operation, viz. six feeders, six forming machines, six lehrs and six stackers with auxiliary equipment. All thereof were under lease-license agreements between debtor and Hartford Empire Company, the owner of patents covering said equipment. Under said agreements debtor paid in cash about $161,000.00 as license fees and in addition thereto paid out considerable funds for engineering and installation costs, so that the cash investment therein amounted to $255,948.42 on its books and records. Fixed production royalties were required to be paid and certain minimum royalties during non-operation.

Said lease-license equipment is vital and essential to any operation of debtor's plant as without same it would be a mere shell. Early realizing this the trustees contacted representatives of Hartford Empire Company. The situation was that as of March 1, 1948 debtor owed Hartford Empire Company $21,803.70 for production royalties due and unpaid for the months of September through December 1947 and for January and February 1948. Debtor was also indebted to Hartford Empire Company to the extent of about $26,000.00 on open account for various service and engineering costs which had accrued after installation of said equipment and

prior to March 1, 1948. The lease-license agreements contained provision for revocation and termination thereof upon default in payment of royalties as well as upon bankruptcy or receivership of Neville Island Glass Company, Inc. [fol. 1890] As of May 5, 1948 Hartford Empire Company finally proposed its willingness to permit retention of said equipment by the trustees to September 1, 1948, later to December 31, 1948, provided the trustees make payment of the defaulted production royalties aforesaid amounting to $21,803.70 and of certain minimum royalties after March 1, 1948. The trustees submitted that matter to the Court by petition for instructions and in several hearings considerable objection was raised that the item of $21,803.70 was an open and unsecured account but was being converted into a preferential claim for immediate payment as an administration expense. On June 29, 1948 the Court entered an order refusing to approve said proposal and in opinion rendered at the same time it was held that the Reorganization Court and the trustees should have a reasonable period to determine whether or not a plan of reorganization is possible, during which time Hartford Empire Company should not be permitted to remove said equipment. Also in said order of court the trustees were authorized to pay to Hartford Empire Company minimum royalties on said equipment at $1262.50 monthly from and after March 1 to December 31, 1948. However the result thereof was as follows:—

> The trustees promptly rendered payment to Hartford Empire Company for the months of March through July 1948. By registered letter dated July 22, 1948 and received by the trustees before July 26, 1948 Hartford Empire Company rejected said payment and served upon the trustees notice of revocation and termination of said lease-license agreements, which notice would be effective after the expiration of thirty days from receipt thereof.
>
> [fol. 1891] As a licensee under said lease-license agreements debtor had the option to request cancellation of the lease-license agreements and to make outright purchase of all said equipment at a price arrived at in accordance with formulae set up in final decree

by the United States District Court for the Northern District of Ohio, Western Division, in Civil Action No. 4426, between United States of America and Hartford Empire Company, which is often referred to as the "Toledo judgment". The trustees were informed that thereunder the cost for outright acquisition of all said lease-license equipment approximated a little more than $291,000.00 plus any existing indebtedness.

The trustees realized that to permit said notice of revocation and termination to become effective would mean the end of said lease-license agreements and the loss of the option aforesaid, a result plainly calamitous. Accordingly they presented their petition to the Court to restrain Hartford Empire Company from effectuating said notice of revocation and termination and hearing was fixed for August 19, 1948, thus in advance of the expiration of the thirty day period. Several days before August 19, 1948 counsel for Hartford Empire Company opened discussion with the trustees relative to any possibility of settling all matters involved by declaration and definition of the rights of the parties. Of a consequence in open court on August 19, 1948 the hearing was continued to August 26, 1948 and again on the latter date was continued upon motion made in open court to [fol. 1892] September 10, 1948 for the purpose of permitting settlement negotiations, all without prejudice and with full retention of the status in the meanwhile.

Final settlement agreement was submitted to and approved by the Court on September 10, 1948, whereby the trustees and any entity emerging from this reorganization proceeding have the option of purchasing and acquiring said lease-license equipment on or before December 31, 1948 for the sum of $302,589.23 made up of $21,803.70 defaulted production royalties and $280,589.23 as basic purchase price, both said sums being required under the "Toledo judgment", with further provision that in the event any plan of reorganization filed before December 31, 1948 contains provision for the outright purchase of said equipment at the price aforesaid or for the continued leasing thereof the trustees have the option accordingly and acceptance and approval of such plan by March 31, 1949 is automatic exer-

cise thereof. Such continuance of leasing requires under the "Toledo judgment" outright purchase of some of said equipment (no longer available under lease) at a cost of $77,174.55 plus payment of the defaulted royalties amounting to $21,803.70 or a total of $98,978.25. Upon failure to finally exercise any of said options Hartford Empire Company is entitled to repossess said equipment which shall in the meanwhile remain in the Nexille Island Glass Company, Inc. plant at the risk of Hartford Empire Company.

(It may be stated that the continuing uncertainty relative to said lease-license equipment rendered it inadvisable to file this report earlier).

[fol. 1893] Elevator Contract—During the construction of the plant Frazier-Simplex Inc. as agent of the Company issued purchase order to Marshall Elevator Company in approval of its quotation for the installation of a freight elevator at a cost of $12,252.00, one of the terms of which provided current billings up to seventy percent of materials delivered. The Company requested extensions of time for installation of said elevator but some of the material had been delivered and Marshall Elevator Company had billed debtor $6425.00 on account thereof. Following appointment of the trustees herein Marshall Elevator Company's petition for reclamation was allowed by the Court after full hearing.

Compressor Unit—On February 14, 1947 the Company entered into a contract with Ingersoll Rand Company (of New York) for an additional compressor unit complete with accessory equipment to cost $30,831.00 on account of which advance payments were made to the extent of $10,790.55. In the meanwhile a trade account payable to Ingersoll Rand Company arose for materials and replacement parts on open credit in the amount of $1,973.39. Following their appointment the trustees approached Ingersoll Rand Company to ascertain its reaction to cancellation of said contract and received advices that the cancellation charge would be $18,139.00 so that after application of the $10,790.55 an unsecured claim of $7,348.45 would result which together with the $1,973.39 would total $9,321.84. In the light thereof the trustees by letter to Ingersoll Rand Company stated that acceptance or rejection of said contract must be held in abeyance so that consideration may be given thereto in any plan of reorganization.

[fol. 1894] Executory Contracts—On petition of the trustees filed April 23, 1948 the Court approved the action of the trustees in terminating all contracts for current supplies of materials and supplies to debtor and the time was extended for acceptance or rejection of certain executory contracts including lease-license agreements with Hartford Empire Company, the elevator contract with Marshall Elevator Company, the option agreement with Pittsburgh Coke & Chemical Company for acquisition of additional land and the agreement with it for supply of gas fuel. At the same time hearing was fixed as to rejection of other contracts and by order entered April 29, 1948 the trustees were authorized to reject the employment agreements between debtor and Walkerman, D. Dugan, president, Herbert C. Abrahamson vice-president in charge of sales, Raymond A. Senkbiel vice president in charge of production, Herbert H. Sommers sales agent and Robert M. Ross sales agent.

Claims Available to Debtor

Accounts Receivable—The trustees have proceeded to collection of accounts receivable as reflected on the books and records of debtor including the assigned accounts. In quite a few instances they were met with assertions that Neville Island Glass Company, Inc. had accepted complaints of unsatisfactory product but no credit memoranda were found and nothing in the records of debtor substantiated such assertions. Inquiries developed the likelihood of oral allowances in some instances and where the claimed setoffs appeared reasonable on the basis of such information to the trustees they made settlement and collection of net balances accordingly. In other instances the trustees rejected such claimed setoffs and it may be that suits will be required to [fol. 1895] establish certain of the accounts receivable.

There is attached hereto and made part hereof as Exhibit "B" a brief statement of all cash transactions by the trustees to date.

Customers' Advances—(1) The sum of $150,000.00 was received from Pittsburgh Glass Containers Inc. (of New York) as "advance payment" for the entire output of one production line for a period of two years under an arrangement entitling it to deduct semi-monthly 1/24th of said ad-

vance against current invoices. Apparently there was some difficulty in collecting the balances over and above said deductions and as of December 23, 1947, the date of last shipment, the books of debtor indicate an account receivable approximating $71,000.00 against a remaining balance of said "advance payment" of about $53,000.00: Under one aspect the trustees might demand payment of the $71,000.00, thus relegating the depositor to whatever its legal position might be in regard to the balance of said "advance payment". The trustees are informed that there is serious question about collecting such account and inasmuch as "advance payment" would appear to mean exactly that the practical as well as the legal solution was reached whereby the remaining balance of said "advance payment" was applied to the $71,000.00 item so that the account receivable was reduced to $18,000.00.

(2) The sum of $100,000.00 cash was advanced by Glass Sales Corporation (of Chicago) under an arrangement for "return" at the rate of $6250.00 in each twenty day period thereafter. It would appear that the Company made no actual repayments but that M. Jacob & Son of Detroit, a [fol. 1896] subsidiary of depositor, took periodic credits of $6250.00 against current invoices to it. As of March 1, 1948 the balance of said deposit was $12,500.00; M. Jacob & Son owed about $3400.00 and National Bottling Company of Chicago, another subsidiary of depositor, owed about $9200.00; and both those subsidiaries assert the right of credit pro tanto against the $12,500.00. The trustees believe that Glass Sales Corporation should be relegated to the position of unsecured creditor for the remaining $12,500.00 and that suits be instituted to collect the accounts receivable aforesaid.

(3) Metropolitan Bottle Company (of New York) late in 1947 deposited $5,000.00 as "advance payment" to be credited against current invoices at the rate of $1000.00 per month. As of March 1, 1948 the accounts receivable against it approximated $11,000.00 after crediting against the deposit $1000.00 in January and a like sum in February 1948. The trustees have applied the $3000.00 balance of said deposit against the $11,000.00 account receivable so that the net amount of the latter is $8000.00, collection of which apparently must result from suit.

Overshipments—In some instances it was found that debtor, by reason of inadequate warehouse storage facilities, made shipments to customers in the hope of acceptance by the latter but upon refusal the Company had to place the goods in public storage. To every extent possible the trustees have made sale of such goods either subject to or upon payment of the storage charges.

Management of Debtor—When operation of the plant was started on March 31, 1947 it was an established fact that the cost of construction exceeded original estimates by about $500,000.00. At that time the only apparent working capital [fol. 1897] consisted of the deposits or advance payments by customers to such extent as they may not have been applied on account of construction costs. Although prospects then seemed bright on the basis of attractive price structure and continuing demand the Company was not basically solvent.

Hindsight decision now might indicate a conclusion one way but failure then to commence operations surely would have resulted in immediate bankruptcy. It would appear that all parties were most sanguine and optimistic about the success of this enterprise.

It is inconceivable that the directors did not become aware of practically continuous operating losses throughout the year 1947. On one or more occasions that subject matter came up for discussion in board meetings and in each instance corporate officers advanced convincing explanations with strong representation of betterment in the light of anticipated increase in sales and promised economies of operation. Again it is certain that bankruptcy would have resulted upon a shut down.

In so far as ascertained the officers and directors were actuated by what they thought were the best of motives. President Dugan appears throughout as a confirmed optimist and there was considerable reliance upon his reputation, experience and standing in the industry. Aside from contract salaries and commissions to certain officers (at perhaps rather high rates), there is no evidence to suggest misapplication of funds or any personal benefit whatsoever.

Whether or not there was such culpable negligence as to [fol. 1898] constitute the basis of any cause of action is still open for investigation and decision.

Subordination—There has been exhaustive investigation to ascertain if any facts exist which might raise the question as to whether or not any or all the claims of Pittsburgh Coke & Chemical Company should be subordinated to those of creditors and possibly of stockholders. The result thereof is briefly summarized as follows:—

Following incorporation and organization of the Company proceeds of bond and stock sales to the extent of $1,137,460.00 were deposited with Colonial Trust Company, trustee under the mortgage indenture, against disbursements upon engineers' certificates for construction costs. As hereinbefore set forth said construction costs considerably exceeded estimates and Pittsburgh Coke & Chemical Company advanced a net total of $450,000.00 additional cash for $500,000.00 face amount of bonds under the following circumstances:—

Mr. Dugan had been most optimistic that said excess of plant construction cost could be financed over a reasonable period of time out of operations. It soon became manifest that this was impossible because of severe price declines and reduction in demand. Needing immediate cash the Company approached Pittsburgh Coke & Chemical Company to purchase $250,000.00 of Series C bonds maturing in ninety days to be redeemed out of the proceeds of $500,000.00 of Series D bonds to be sold at 90.

[fol. 1899] Pittsburgh Coke & Chemical Company further assisted in financing operations by advancing $50,000.00 cash on May 14, 1947, against pledge of accounts receivable which later became the revolving collateral fund hereinbefore detailed. It had received nothing on account of by-product gas being furnished and from time to time thereafter it made unsecured cash advances to Neville Island Glass Company, Inc. As shown on Exhibit "A" hereto the unsecured trade accounts payable to it and its subsidiaries are $195,141.38 and the unsecured cash advances are $190,179.47. In addition to the bonds it is secured by pledged or discounted accounts to the extent of $73,828.18.

Whether or not any facts exist calling for subordination is still open for investigation and decision.

Committee and Other Representations

Early in the course of this proceeding there was organized a Protective Committee for Unsecured Creditors with Frank W. Stonecipher, Esq. of Pittsburgh, Pa., as its counsel who petitioned the Court that said Committee receive all notices as part of the record which has been done. On several occasions the trustees have met with that committee and its counsel to discuss the business, assets and affairs of debtor and at all times there has been on both side the proffer of every cooperation.

Several individual stockholders represented by A. E. Kountz, Esq. of Messrs. Kountz, Fry, Staley and Meyer, Pittsburgh, Pa., petitioned the Court to receive notices and [fol. 1900] there has been compliance accordingly.

It should be freely stated that counsel and accountants representing the Securities and Exchange Commission have throughout been indefatigable and constantly solicitous for the public interest. They have withheld no effort in regard to the most extensive inquiry, investigation and correspondence. Counsel has been present in Court at and participated actively in various hearings.

Matters for Consideration

Before any operations can be resumed it will be necessary to reline the furnace with fire brick at an estimated cost of $57,583.33 as shown on Exhibit "A". There should be adequate extension of warehouse facilities, the cost of which might well run from $100,000.00 to $300,000.00 according to the ultimate extent thereof. Outright acquisition of the lease-license equipment from Hartford Empire Company will require $302,589.23 or in the alternative continued leasing of said equipment will require the immediate outlay of $98,978.25.

So far as the trustees have learned the glass-container industry over the country is set up at a high rate of over productive capacity. The business generally is in a greatly depressed condition and it has come to the attention of the trustees that certain large manufacturers have closed down some of their plants and reduced their operations to a bare minimum. Presently there is no indication of demand which

would to any extent equal or approach the productive capacity existing in this industry.

[fol. 1901] The real problem involved in any suggestion for a plan of reorganization relates to obtaining new money to provide funds necessary for immediate outlay, such as plant rehabilitation, warehouse extension and lease-license equipment as well as to furnish a fair and reasonable amount of working capital.

In submitting these matters for consideration it is not the purpose or intention of the trustees to preclude any suggestion which the parties in interest may care to offer. Serious consideration should be given by all parties in interest to a plan of reorganization and suggestions should be freely made leading to the best possible plan. These suggestions must be forthcoming immediately in view of the December 31, 1948 dead line under the Hartford Empire Company agreement aforesaid.

Joseph H. Bialas, Trustee.

T. F. Ryan, Attorney for Trustees, 2610 Grant Building, Pittsburgh 19, Pa.

[fol. 1902] United States of America
Western District of Pennsylvania, ss:

I, James H. Wallace, Jr., Clerk of the United States District Court for the Western District of Pennsylvania, do hereby certify that the annexed and foregoing is a true and full copy of the original Report Of Trustee as to Examination Under Sections 21(a) and 167 of the Bankruptcy Act, Report of Special Master, Statement of Investigation by Trustees, Petition, Order of Court, Petition of Joseph H. Bialas, Trustee, To Compromise and Terminate This Reorganization Proceeding, Petition for Allowance of Compensation to Joseph H. Bialas, Trustee, Petition of Disinterested Trustee for Direction as to Form and Manner of Submission of Trustee's Report and Statement Under Section 167(5) of Chapter X of The Bankruptcy Act and Related Matters. In re: In the Matter of Neville Island Glass Company, Inc. In Proceedings for the Reorganization of a corporation—No. 21680, now remaining among the records of the said Court in my office.

In Testimony Whereof, I have hereunto subscribed my name and affixed the seal of the aforesaid Court at Pittsburgh this Sixth day of April, A.D. 1960.

James H. Wallace, Jr. Clerk. By Robert Marcinowski, Deputy Clerk.

Estimates

Ammonia	All or substantially all in glass
Antiseptics	All or substantially all in glass in consumer size
Baby Foods	80% glass; 20% cans
Beer and ale	39% cans; 6½% non-returnable glass; balance returnable glass
Brilliantines	All or substantially all in glass in liquid form and some collapsible tubes with different formulation.
Catsup	All or substantially all in glass in consumer size—Institutional all or substantially all in cans—plastic film or containers for individual servings—very small
Cheese spreads	90% glass; balance aluminum tumblers, plastic tubes and film, collapsible metal tubes, foil, crocks and paper; no cans
Chile sauce	All or substantially all in glass
Cider	All or substantially all in glass
Citrus segments, chilled	All or substantially all in glass
Citrus segments, non-refrigerated	95-100% cans

Coffee, ground	Less than 1% in glass; balance in cans and paper bags
Coffee, soluble	99% glass; 1% cans
Cologne	95-100% glass—some aerosols of glass, metal and plastic
Corn	All or substantially all in cans
Corned beef hash	95% cans
Cosmetic creams	90% glass; 5% plastic; 5% collapsible tubes
Crabmeat	All or substantially all in cans
Cranberry sauce	All or substantially all in cans
Cream, whole	50% glass; 50% paper—no cans
Cured ham	All or substantially all in cans
Distilled spirits	All or substantially all in glass
[fol. 1905] Drugs, ethical in liquid form	All or substantially all in glass
Flavoring extracts	All or substantially all in glass
Food sauces other than tomato sauce	All or substantially all in glass
Fruit spreads and preserves	More than 95% in glass for home consumption
Green beans	95% cans; 5% glass
Hair lacquer	All or substantially all in metal
Hair tonic	More than 95% in glass
Hominy	All or substantially all in cans
Horse radish	All or substantially all in glass
Juices, concentrated and frozen	All or substantially all in cans
Lard	All or substantially all in cans; a little paper
Lighter fluid	90% cans—10% glass
Lima beans	All or substantially all in cans
Liquid bleach	All or substantially all in glass
Liquid shoe polish	All or substantially all in glass
Lubricating grease	All or substantially all in cans
Luncheon meat	All or substantially all in cans
Machine oil	Substantially all in cans
Maraschino cherries	All or substantially all in glass; in consumer size
Mayonnaise	All or substantially all in glass in consumer size

Milk, whole	55% paper—45% glass
Mineral oil	All or substantially all in glass
[fol. 1906] Motor oil	All or substantially all in cans
Mouth wash	All or substantially all in glass
Mustard, prepared (consumer size)	95% glass—5% plastics
Nail polish	All or substantially all in glass
Nail polish remover	All or substantially all in glass
Olives, green	All or substantially all in glass
Olives, ripe	90-95% cans; balance glass
Paint, oil base (household, interior and exterior)	None in glass
Paint, polyvinyl acetate base (household, interior and exterior)	None in glass
Paint, rubber base (household, interior and exterior)	None in glass
Paste shoe polish	All or substantially all in cans
Peaches	95% cans—5% glass
Peanut butter (consumer size)	90% glass—5% plastic and 5% cans
Pears	95% cans—5% glass
Peas	All or substantially all in cans
Perfume	All or substantially all in glass
Pickles	Over 95% glass for household use—balance between cans and plastic film
Pineapple	All or substantially all in cans
Proprietary medicine in liquid form	95% glass—5% plastics
Prune juice	All or substantially all in glass
Pumpkin	All or substantially all in cans
Relish (consumer size)	All or substantially all in glass
Salad and cooking oils (consumer size)	85% glass; 15% cans
Salad dressings	100% glass for retail
Salmon	All or substantially all in cans
[fol. 1907] Sardines	All or substantially all in cans
Single strength blended orange and grapefruit juice	Over 95% cans

Single strength grapefruit juice	90-95% cans; balance glass
Soft drinks	98½% glass; balance cans (1% is one way bottle)
Solid and semi-solid shortening	All or substantially all in cans
Soup (Liquid form)	All or substantially all in cans
Squash	All or substantially all in cans
Starch (Liquid form)	All or substantially all in glass
Sweet Potatoes	All or substantially all in cans
Syrup, chocolate	95% cans—5% glass
Toilet water	All or substantially all in glass
Tomato juice	Over 95% in cans
Tomato paste	All or substantially all in cans
Tomato puree	All or substantially all in cans
Tomato sauce	All or substantially all in cans
Tomatoes, stewed	All or substantially all in cans
Tomatoes, whole	All or substantially all in cans
Tuna fish	All or substantially all in cans
Vinegar	All or substantially all in glass consumer size
Wax beans	Over 95% cans—balance glass
Wet pack pet foods	90-95% cans; balance glass
Wine	All or substantially all in glass
Writing ink	All or substantially all in glass except refill cartridges

[fol. 1911] DEFENDANTS' EXHIBIT P

The Billion Dollar Glass Container Business

Richard L. Cheney, Executive Director of the Glass Container Manufacturers Institute, on a recent visit to the West Coast spoke before meetings of Security Analysts in San Francisco and Los Angeles. The accompanying article liberally quotes from the addresses made by Cheney. For example, note his remarks anent the "cryers of doom" which, at this time, are particularly apropos. He also pointed out that in 1957, for the third straight year, U.S. shipments of new glass containers reached an all-time high bringing the glass container business into the billion-dollar category for the first time.

GCMI advertisements in leading consumer magazines are reproduced in full color and have ideal potential for classroom use. "The ad that shows a child getting milk from a glass bottle (above) stimulated our food-and-health studies" said a Maryland school teacher. She further added that the fresh pure white of the milk seen through the glass made the children "feel thirsty."

The current recession has not adversely affected the glass container business. In recent speeches before The Security Analysts of San Francisco and Los Angeles, Richard L. Cheney, Executive Director pointed to figures released by the Department of Commerce to prove that point.

Shipments of new glass containers in the first four months of '58 were 6.3 billion units, 2.4% over the figure for the comparable four months in '57. Most of the increase in '58 was in the end-use categories of bottles and jars for soft drinks, food and beer, Cheney noted.

These figures continued the trend of the past several years. In '57 the glass container business became a billion-dollar industry—$784 million in containers and $284 million in closures. Last year the industry shipped 20.2 billion new units, said Cheney, or enough to supply every person in the U.S. with 118 bottles and jars.

For those who see "doomsday" approaching as new competition comes along, the following remarks by Cheney seem quite pertinent:

"Because of the ancient history associated with glass containers, people have tended to "kill-off" this business every time a new competitor of glass has come along. And there have been several! We can only say with Mark Twain that 'reports of our death have been grossly exaggerated'.

"Let's go back to about 1939 when the paper milk carton was introduced on a volume basis in supermarkets. 'This is the beginning of the end,' many people gloomily predicted in speaking of the faithful old milk bottle. But was it? How many had milk delivered at their door this morning in paper cartons? Probably very few, because home delivery is 90% in glass. In point of fact, we are selling today just as many milk bottles as we did in 1939, and our market studies in leading cities indicate that glass is even returning to supermarkets!

"Next the beer can came along. Again many people read what they thought was very plain handwriting on the wall. Beer bottles, they said, were finished. Shortly thereafter, however, we were able to develop the economies of quart beer bottles as well as the no-deposit, no-return beer bottles —with the result that today 65% of packaged beer is bottled in glass, and we are selling five times as many beer bottles as we were twenty years ago when the beer can was introduced. This, of course, is by reason of the growing use of

the disposable no-deposit bottle in place of the returnable bottle which averages 21 trips.

"The post-war boom in plastics, however, had the grave-diggers busy again. 'Plastics will make glass obsolete' they warned. Yet in the packaging of cosmetics—where plastics (largely squeezable containers) have had great growth—glass containers are currently enjoying their fastest rate of growth.

"Despite everything, the fact of the case is that this year—1958—the glass container business is steadily growing and constitutes an important part of America's dynamic packaging industry."

Cheney also made the following interesting comment on the historical developments of the glass container industry in California:

"In California, the history of bottle-making goes back to 1890 when the Abramson-Heunisch Co. established the State's first glass container plant in San Francisco. Prior to that, Abramson-Heunisch bought bottles from Eastern makers, reselling them to local packers and bottlers. The high cost of shipping bottles, coupled with increasing demand, led Abramson-Heunisch to open California's first glass container factory.

"In those early days there was a scarcity of the raw materials from which glass is made. Silica deposits had not as yet been developed, and it was necessary to bring soda ash in by ship, first around Cape Horn, and later through the Panama Canal.

"Shortly after 1900, the Illinois Glass Co. bought an interest in California's pioneer glass container plant, and the name was changed to Illinois-Pacific Glass Co. While one or two other companies came and went around the turn of the century, it was not until about 1920 that bottle-making really got underway in California and gave any indication of its present size and stability."

Today, with 13 of the 15 important manufacturing units on the West Coast, California has more glass container plants than any other state except one, and accounts for a sizable portion of the total output of glass containers.

This Inquiry is Authorized by Act of Congress (13 U.S.C. 181) Which Requires that You File Report.

Budget Bureau No. 41-R7 11.9
Approval Expires January 31, 1959

Form M34D
(1-15-57)
(Formerly M75D)

U.S. Department of Commerce
Bureau of the Census

(Please correct if name or address has changed)
Form M34D (Formerly M75D)

Metal Cans

To: Bureau of the Census, Washington 25, D.C.
Attn: Industry Division

Retain This File Copy

Instructions

I—Mailing

This form is to be used in reporting metal can shipments covering each month of 1957. The report will be due within 15 days following the end of each month. It will be mailed back to you each month for the preceding month's figures. Return this form in the enclosed envelope which requires no postage. For your record, post each month's figures on the file copy which was sent to you with the initial mailing.

II—Who Should Report

All manufacturers of metal cans should submit reports, including those producing for their own use as well as those producing for sale to the trade. A manufacturer producing metal cans for use by plants of an affiliate, subsidiary or parent company should report transfers of metal cans from the producing plant to the consuming plant as "own use" shipments. A manufacturer with more than one plant producing cans should submit separate reports for each of his plants.

If you ship cans exclusively for your own use as defined above, check the box below marked "For own use" and complete your report. If you ship cans exclusively for sale to the trade, check the box marked "For sale," and complete your report. If you ship cans both for own use and for sale, make out two separate reports, one showing shipments for own use, the other shipments for sale. The appropriate box, viz. "For own use" or "For sale," should be marked on each of these reports.

III—What to Report

Shipments should be reported by the type of product packed in terms of the base boxes of steel consumed in the manufacture of cans. In all cases, the company actually manufacturing the cans should report its total shipments, including those made to other can manufacturers. Can manufacturing companies purchasing cans from other manufacturers should exclude from their reports the cans which they purchase and should limit their figures to shipments of cans of their own manufacture. Separate figures should be submitted for shipments for your own use and shipments to the trade.

IV—Metal Cans Defined

Metal cans covered by this report are defined as single-walled containers constructed wholly of tin plate, terneplate, black plate, or waste plate designed for packing products. This term includes all pails and drums manufactured from steel sheets of 29 gauge or lighter but does not include those produced from steel sheets of heavier than 29 gauge. Also excluded from the scope of the definition are ice cream cans and fluid milk shipping containers.

☐ For own use ☐ For sale

Remarks—Explain in this section, indicating the month and column number, any changes in the types of cans shipped and confirm any exceptional month-to-month shifts in production.

Name and address of person who should be contacted if questions arise regarding this report.

Telephone No.

"For own use" or "For sale," should be marked on each of these reports.

III—What to Report

Shipments should be reported by the type of product packed in terms of the base boxes of steel consumed in the manufacture of cans. In all cases, the company actually manufacturing the cans should report its total shipments, including those made to other can manufacturers. Can manufacturing companies purchasing cans from other manufacturers should exclude from their reports the cans which they purchase and should limit their figures to shipments of cans of their own manufacture. Separate figures should be submitted for shipments for your own use and shipments to the trade.

IV—Metal Cans Defined

Metal cans covered by this report are defined as single-walled containers constructed wholly of tin plate, terneplate, black plate, or waste plate designed for packing products. This term includes all pails and drums manufactured from steel sheets of 29 gauge or lighter but does not include those produced from steel sheets of heavier than 29 gauge. Also excluded from the scope of the definition are ice cream cans and fluid milk shipping containers.

☐ For own use ☐ For sale

Remarks—Explain in this section, indicating the month and column number, any changes in the types of cans shipped and confirm any exceptional month-to-month shifts in production.

Name and address of person who should be contacted if questions arise regarding this report. Telephone No.

Certification—The undersigned certifies that the information contained in this report is correct and complete to the best of his knowledge and belief.

Signature of authorized official Name of company

Title Date Address of company

This inquiry is authorized by law. Your report is accorded confidential treatment, subject to the provisions of law. Your Census report cannot be used for purposes of taxation, investigation or regulation.

[fol. 1914] DEFENDANTS' EXHIBIT X

Interrogatory 6.

6. (a) Give the names and addresses and the sales volume, in dollars and in units, for each of the years 1953 to 1956, inclusive, of the manufacturers of metal cans which are claimed to be the largest such manufacturer and the third largest such manufacturer, respectively, in the United States. (paragraph 8)

(b) Give the total sales, in dollars and in units, of metal cans sold in the United States for each of the years 1953 to 1956, inclusive. (paragraph 8)

[fol. 1915] Answer to Interrogatory No. 6 (b).

6. (b) The total sales in dollars and in units of metal cans sold in the United States for each of the years 1953 to 1956, inclusive:

	Dollars	Units
1953	N.A.	N.A.
1954	$1,292,570,000 (a)	N.A.
1955	1,387,262,000 (a)	39,190,151,000 (b)
1956	1,540,000,000 (a)	41,826,721,000 (b)

N.A.—Not available.

(a) These totals are value of shipments based upon the Annual Surveys of Manufacturers published by the Bureau of the Census, Department of Commerce.

(b) Steel consumption converted into the number of #2 cans which might have been produced from the amount of steel consumed. These figures were estimated and published by the Can Manufacturers Institute, Inc. and the plaintiff has no way of verifying their accuracy.

In the Supreme Court of the United States

OCTOBER TERM, 1963

No. ----

UNITED STATES OF AMERICA, APPELLANT

v.

CONTINENTAL CAN COMPANY AND

HAZEL-ATLAS GLASS COMPANY

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE SOUTHERN DISTRICT OF NEW YORK

JURISDICTIONAL STATEMENT

OPINION BELOW

The opinion of the district court, comprising its findings of fact and conclusions of law (Appendix, *infra*), is not yet reported.

JURISDICTION

The judgment of the district court was entered on April 16, 1963. The notice of appeal was filed by the United States on June 14, 1963. The jurisdiction of this Court is conferred by Section 2 of the Expediting Act of February 11, 1903, 32 Stat. 823, as amended, 15 U.S.C. 29. *United States* v. *du Pont & Co.*, 353

U.S. 586; *United States* v. *Columbia Steel Co.*, 334 U.S. 495.

QUESTIONS PRESENTED

The ultimate question presented is whether the government's evidence showed a violation of Section 7 of the Clayton Act so that the district court erred in dismissing the complaint at the close of the government's case.

This question involves three subsidiary questions of law:

1. Whether mergers eliminating "interindustry" competition are subject to Section 7 of the Clayton Act.

2. Whether, in order to prove that a merger may substantially lessen competition, the government must in every case use statistical evidence of market shares in a defined product market; and

3. Whether the district court erred in concluding that the government had failed to show that this merger would substantially lessen competition in the market for containers for food-canning.

STATUTE INVOLVED

Section 7 of the Clayton Act, 38 Stat. 731, as amended, 64 Stat. 1125, 15 U.S.C. 18, provides in pertinent part:

> No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no corporation subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another cor-

poration engaged also in commerce, where in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly.

STATEMENT

1. THE MERGING COMPANIES

Continental, a New York corporation organized in 1913 through the merger of three metal container manufacturers (GX 786),[1] has since acquired 24 other companies in that same field and many more in other aspects of the packaging line. The latter group includes seven producers of flexible packaging; one manufacturer of polyethylene bottles and similar plastic containers; 14 companies producing paper containers and paperboard, including fibre drums, folding boxes, and corrugated shipping containers; four (including Hazel-Atlas) making closures for glass containers; seven producing a miscellany of products; and one, Hazel-Atlas, producing glass containers. By 1955, Continental had total assets of $382 million and operated 72 domestic plants, of which 30 had been obtained through acquisitions (GX 785, 786, 900, 1211, 1213; App. 9a–11a).

In 1955 Continental shipped approximately 33 percent of all metal containers sold in the continental United States and was the second largest company

[1] These companies were Continental Can Company, a New Jersey corporation; Export and Domestic Can Company, a New York corporation; and Standard Tin Plate Company, a Pennsylvania corporation.

in the field. The leading producer, American Can Company, shipped 37 percent so that Continental and American together shipped approximately 71 percent of all metal containers. The third largest, National Can Company, shipped approximately 5 percent. Between 75 to 90 other companies shared the remaining 24 percent of the market (Tr. 1006; GX 800–803; App. 19a–20a).

Hazel-Atlas, a West Virginia corporation organized prior to 1900, had operated 13 plants located throughout the country before the acquisition. It had net sales in 1955 of more than $79 million, and assets in excess of $37 million. It had always operated at a profit and had not missed a dividend since 1907 (Tr. 835). Hazel-Atlas shipped approximately 9.6 percent of the glass containers in the continental United States, exceeded only by Owens-Illinois Glass Company (34.2 percent) and Anchor-Hocking Glass Company (11.6 percent). The remaining 44.6 percent of the market was split among at least 39 others (App. 12a, 22a).

A few weeks after its acquisition of Hazel-Atlas in September 1956, Continental acquired the Robert Gair Company, Inc., a leading manufacturer of paper and paperboard products.[2] Earlier in 1956, Continental

[2] Gair had net sales in 1955 of $160.2 million and assets of $134.9 million. Its products included corrugated shipping containers used extensively in the shipment and packaging of glass and metal containers. On October 30, 1956, the government filed another complaint against Continental which alleged that its acquisition of the Robert Gair Company violated Section 7 of the Clayton Act. Pursuant to order of the court, all proceedings in the *Robert Gair* case were stayed pending determination of the *Hazel-Atlas* case.

had also acquired the White Cap Company, a leading producer of vacuum-type metal closures for glass food containers (GX 1211, 1212; App. 10a).[3] As a result of these three mergers, Continental's net sales and operating revenues rose from $666 million in 1955 to more than $1 billion in 1956. Its assets rose from $382 million to more than $633 million (App. 11a).

2. THE MERGER AND THE DECISION BELOW

On learning of Continental's plans to acquire Hazel-Atlas, the government sought to prevent the merger under the terms of a 1950 consent judgment (in a suit aimed at price-fixing and lease tie-in arrangements) which barred Continental from acquiring any more "container" manufacturers. In August of 1956, the district court in California, finding that the term "container" as used in the judgment did not encompass glass containers, held that the consent decree did not cover the proposed acquisition (App. 1a, 2a).[4]

The United States thereupon filed the complaint in this action on September 10, 1956, and its request for a temporary restraining order was denied three days later. On that day, Continental acquired all of the assets, properties, business, and goodwill of Hazel-Atlas in exchange for 999,140 shares of Continental

---

[3] White Cap produced approximately 18.5 percent of all types of metal closures made from tin plate in that year. Two years later, when such figures became available, it was determined that White Cap had approximately 60 percent of the production and shipment of all vacuum closures made from tin plate (GX 800–803; App. 28a).

[4] *United States* v. *Continental Can Company*, 143 F. Supp. 787 (N.D. Cal.).

common stock and the assumption by Continental of all the liabilities of Hazel-Atlas (App. 2a; Answer).

After extensive discovery proceedings by both parties, the trial began in June 1960. The government called 78 witnesses and introduced more than 1,200 exhibits. At the conclusion of the government's case, defendants moved to dismiss under Rule 41(b) of the Federal Rules of Civil Procedure, claiming that on the law and the facts, defendants were entitled to final judgment on the merits.[5] The district court on December 8, 1960, decided to grant the motion in a brief oral statement which indicated that the written findings and opinion, as well as the judgment, would follow. Since no opinion or findings had been rendered when this Court, on June 25, 1962, announced its decision in *Brown Shoe Co.* v. *United States*, 370 U.S. 294, the government requested the district court to reconsider its oral decision in the light of that opinion (App. 3a).

On April 15, 1963, the district court issued its written opinion incorporating findings of fact and conclusions of law, and granting defendant's motion for final judgment (Appendix). The court identified three classes of products produced by Continental and Hazel-Atlas which it considered to be relevant to the merger (metal, glass and plastic containers)[6] and

---

[5] On such a motion in a case being tried without a jury, the district court must weigh and evaluate all the evidence then presented and determine whether or not plaintiff's proof warrants the relief sought. (F.R. Civ. P. 41(b); see 5 Moore's *Federal Practice* (2d ed.), pp. 1044–1046).

[6] We do not here challenge the district court's ruling that closures (devices used to close and seal various containers) are not a separate line of commerce.

characterized each as being produced by a separate industry (App. 13a, 18a–27a, 35a). While the court found that there existed "substantial and vigorous inter-industry competition between these three industries and between various of the products which they manufactured" (App. 35a), such competition was held insufficient to make such "products from separate and distinct industries" (App. 37a) a single line of commerce under Section 7. It followed, the court held, that this merger was a "conglomerate merger * * * [which] does not result in the elimination of a competitor but merely substitutes the competition of the acquiring company for that of the acquired company in the lines of commerce in which the acquired company was formerly engaged" (App. 47a–48a).

Turning to the 10 lines of commerce which the government contended would suffer anticompetitive effects from this merger,[7] the district court accepted only three: the metal container industry (App. 53a–58a); the glass container industry (App. 58a–63a); and containers for the beer industry (App. 65a–70a), and found no anticompetitive effects in each.[8] In reject-

[7] The lines of commerce advanced by the government were considered by the court below as follows: the packaging industry (App. 50a); the metal container industry (App. 53a); the glass container industry (App. 58a); metal closures (App. 63a); containers for the beer industry (App. 65a); containers for the soft drink industry (App. 70a); containers for the canning industry (App. 76a); containers for the toiletries and cosmetic industry (App. 83a); containers for the medicine and health industry (App. 83a); containers for the household and chemical industry (App. 83a).

[8] The district court held that the relevant geographic market was the United States as a whole (App. 32a). We accept that finding for the purposes of this appeal.

ing the others, the court found that they failed to qualify as relevant submarkets within the criteria suggested in *Brown Shoe Co., supra* (*e.g.*, App. 37a–38a), and further held (App. 92a):

> Moreover, even assuming that any such product markets existed, I have found that there was no proof of any reasonable probability of substantial anti-competitive effects or tendency to monopoly as a result of the acquisition in any of them.

THE QUESTIONS ARE SUBSTANTIAL

This appeal in a major antitrust case presents substantial questions as to the basic standards for applying Section 7 of the Clayton Act to a merger of principal producers of highly competitive but physically distinct goods—in this case metal and glass containers. These competing products are, as the district court recognized (App. 35a–36a), the subject of "substantial and vigorous inter-industry competition" by manufacturers "seeking to enlarge their sales to the thousands of packers of hundreds of varieties" of goods of every sort (App. 35a). "Hazel-Atlas and Continental were part of this overall industry pattern" (App. 35a) and, as we shall show below, their roles in this competition were extremely substantial.

Competition between producers of such physically distinct goods is fully protected by Section 7. The district court, however, held otherwise (see App. 35a–40a). Finding that the production of metal cans and of glass containers was "each * * * a recognized separate industry producing distinct products" (App.

35a), the court concluded that diminution of competition between such industries was not generally judicially cognizable and held that therefore no consequence forbidden by Section 7 could be assumed to follow from even an unjustified elimination of the "inter-industry or inter-product competition" the government had shown (App. 36a–37a). In the court's view, the fact that the government had sought to combine separate and distinct products from separate and distinct industries into single product markets" (App. 37a) indicated that this was not "a horizontal combination" of competitors, but a "conglomerate combination" of noncompeting firms in separate industries for purposes of diversification (App. 38a–39a).

But Section 7 of the Clayton Act draws no distinction between competition within a single "industry" and that between different "industries." A merger violates Section 7 if it has the proscribed anticompetitive effects in "the area of effective competition,"[9] and the purpose of an inquiry into lines of commerce is "to recognize competition where, in fact, competition exists" (*Brown Shoe Company* v. *United States*, 370 U.S. at 326). Here the government proved and the district court found that "substantial and vigorous interindustry competition exists" between metal and glass containers and that "Hazel-Atlas and Continental were part of this overall industry pattern." This finding makes unavoidable an appraisal of the effects of the merger on this competition. Certainly

[9] *United States* v. *Philadelphia National Bank*, No. 83, Oct. Term, 1962, slip op. p. 37; *Brown Shoe Co.* v. *United States*, 370 U.S. at 324; *United States* v. *E. I. du Pont & Co.*, 353 U.S. at 593.

such an appraisal is not rendered unnecessary by a conclusion that the competition is "inter-industry."[10]

In the present case the government established, in two independent ways, that the merger between Continental and Hazel-Atlas would tend substantially to lessen competition. We shall discuss each of these in turn.

1. The competition involved in the present case was well described by the court below (App. 35a–36a):

> Concededly there was substantial and vigorous inter-industry competition between these three industries and between various of the products which they manufactured. Metal can, glass container and plastic container manufacturers were each seeking to enlarge their sales to the thousands of packers of hundreds of varieties of food, chemical, toiletry and industrial products, ranging from ripe olives to fruit juices to tuna fish to smoked tongue; from maple syrup to pet food to coffee; from embalming fluid to floor wax to nail polish to aspirin to veterinary supplies, to take examples at random.

[10] This is amply demonstrated by the facts of *United States v. du Pont de Nemours & Co.* (Cellophane), 351 U.S. 377, where this Court rejected the government's contention that duPont's 75-percent control over cellophane violated the Sherman Act, on the ground that the relevant market was "flexible wrapping materials"—including such widely different products of separate industries as aluminum foil, vegetable parchment and waxed paper. The district court in the present case mistakenly relied upon a quotation from the *Cellophane* opinion stating that a monopoly in one industry could not be justified by showing the existence of remote interindustry competition. But from this statement it, of course, does not follow that a merger of interindustry competitors is not subject to the antitrust laws.

> Each industry and each of the manufacturers within it was seeking to improve their products so that they would appeal to new customers or hold old ones. Hazel-Atlas and Continental were part of this overall industrial pattern, each in a recognized separate industry producing distinct products but engaged in inter-industry competition for the favor of various end users of their products.

Thus, the competition between Continental and Hazel-Atlas covered a great range of closely related products for thousands of end uses. In a principal category, containers for food canning, competition is limited to metal and glass containers. (See *infra*, pp. 14–16). In that line, as we shall indicate below under Point 2, the companies' market shares were proved and provide an independent basis for invalidating the merger. There are many other end uses, however, in which metal and glass containers compete with each other and also with paper, plastics, and additional materials. In these lines, the multiplicity of uses and alternative products make definition of precise market shares impossible. The case therefore presents the question whether the government must always prove statistically the shares of merging companies in a defined market in order to establish that the merger may substantially lessen competition.

We submit that it need not. The inquiry directed by the statute is to ascertain the extent to which competition may be lessened as a result of the merger. It has become customary in merger cases to commence this inquiry by delineating relevant product and geo-

graphic market. Statistics showing the merging companies' shares in such markets is one of the most important means of measuring the potential reduction of competition resulting from a merger (*Brown Shoe Co.* v. *United States*, 370 U.S. 294, 322 fn. 38, 343; *United States* v. *Philadelphia National Bank*, slip op., pp. 41–44). But this process is only a means used to reach an end—an appraisal of the effect of the merger upon competition. It confuses means with ends to construe the "line of commerce" language of Section 7 as requiring statistical market shares of specific lines in all cases.

Interindustry competition, in particular, may present a need for a measure of the substantiality of competition which is alternative to market percentages. The court's opinion indicates other instances of competition comparable to that between metal and glass containers: copper and aluminum products; cotton, wool and synthetic fibers; iron, copper and plastic pipe (App. 36a, n. 38). In each such case, companies from separate industries may compete through a great number of products for the business of an equally large range of customers, with varying competition from firms in other industries. Even in complex cases, as here, it may be possible to isolate lines in which percentages are available because the participation of other industries is negligible (or can be fairly ascertained). Proof of proscribed anticompetitive effects in any such line would invalidate the merger since the statute proscribes anticompetitive consequences "in any line of commerce." But such a demonstration

may not be available in all interindustry mergers (*e.g.*, between the leading aluminum and copper companies), and it is surely unrealistic to attach dispositive effect to percentages in specific product lines, while not recognizing any criteria by which to appraise the substantiality of overall competition between companies.

In a case such as this, we submit that the validity of the merger can be resolved without evidence of market shares. The "interindustry" competition between Continental and Hazel-Atlas which was eliminated by the merger was plainly substantial. As the court below found, the merging companies were the second and third largest in their respective industries; they were part of an "over-all industry pattern" of "substantial and vigorous inter-industry competition"; they competed with one another "for the favor of various end users of their products," each seeking to enlarge its "sales to the thousands of packers of hundreds of varieties of food, chemical, toiletry and industrial products." Continental, the second largest producer of metal containers, had 33 percent of that field and sales of $670,000,000. Hazel-Atlas, the third largest producer of glass containers, had 10 percent of that field and sales of $70,000,000. This evidence clearly "raise[s] an inference that the effect of the contemplated merger * * * may be substantially to lessen competition * * *" (*United States* v. *Philadelphia National Bank*, slip op., p. 43), and thus sustains the government's burden of proof. Absent any

evidence by the defendants that the normal anticompetitive effects of a merger between two such giants in two vigorously competing industries would not take place, the court should have concluded that the government had shown that the merger was in violation of Section 7 of the Clayton Act.

2. While there is much more to the case than the merger's impact on any single group of customers, the errors of disregarding interindustry competition and requiring rigid forms of statistical proof of market shares are both dramatically demonstrated by the district court's failure to recognize the merger's impact upon competition in the manufacture and sale of containers for food canning. A dominant end use of Continental's metal containers and Hazel-Atlas' glass containers is that made by the food-canning industry which consumes an estimated 35 percent of such containers (GX 801, 636). We submit that the government has shown that manufacture and sale of containers for the food-canning industry (as defined below) is an area of effective competition between Continental and Hazel-Atlas. The government's case also raised an inference that the merger would have forbidden anticompetitive effects, because the market shares of Continental and Hazel-Atlas in this line show that the merger is "inherently likely to lessen competition substantially" (*United States* v. *Philadelphia National Bank*, slip op. p. 41).

(a) *Area of Competition.* Food "canning," as defined by the container industry, is the process of

hermetically sealing and heat-sterilizing food.[11] The government's use of this market is based on the undisputed fact, testified to by qualified experts,[12] that metal and glass containers are the only products in the packaging field which are capable of being hermetically sealed and whose contents can be effectively heat-sterilized. These properties are of crucial significance to the "literally thousands of packers purchasing containers for packing hundreds of food products" (App. 81a). Such customers, whose food products must be protected from spoilage and deterioration while awaiting sale, have a choice only between these two types of containers in which to pack their food products. In this field only glass and metal containers compete.

There is a substantial volume of commerce for which glass and metal containers are the only available packaging materials. Continental itself stated that the "annual production of the canning industry amounts to more than 20 billion pounds, representing about 8½ percent of the Nation's food supply," and that containers for hermetically-sealed, heat-sterilized food are "packed in almost 700 million cases or about 20 billion tin and glass con-

[11] Heat-sterilizing is a protective measure applied after the food has been sealed in glass or metal hermetic containers. It consists, basically, of heating the filled containers under pressure to a temperature which is calculated to destroy all, or essentially all, of the bacteria present in the food which would have a tendency to spoil it, and then cooling under controlled conditions (GX 317, 318). A hermetic seal, impermeable to air and other gases, is needed to keep the contents sterile.

[12] *E.g.*, Tr. 111, 126–133, 753–790, 505–506.

396-226—63——2

tainers" (GX 636). The court below would deny this vast field of food processing antitrust protection against mergers like Continental-Hazel-Atlas, on the ground that there was "no showing of reasonable interchangeability of use or cross-elasticity of demand as between metal and glass containers used for packing food" (App. 80a). The court's opinion is colored by its mistaken views about interindustry competition, *supra*, pp. 8–10, and to that extent, its rejection of the canning line was erroneous as a matter of law. As a factual inference, it is clearly erroneous on this record.

The government produced the most graphic evidence of the interchangeability between glass and metal containers in the food canning market: numerous food products packed in both containers. Observations made at retail stores throughout the country showed that packers of more than one hundred food products offered the same products for sale competitively in both glass and metal containers (GX 949, 1158, 1160–1177, 1178A, 1178B, 1179–1201). The record shows that Continental and Hazel-Atlas both served and sought to serve the same categories of processors of a great range of food products (see Record references collected at Government's Proposed Finding No. 95). Within the vast field in which glass and metal food containers actively compete and are interchangeable there may indeed be certain products packed primarily in one container or the other (see DX–N), but this does not vitiate the use of both containers together as a relevant market.

Indeed, even with respect to products sold primarily in one type of container, competition between metal and glass containers still exists, for the evidence amply demonstrates that metal and glass container manufacturers are continuously engaged in attempts to sell to packers using the competing container.

For example, Continental carefully studied and planned advertising campaigns, selling programs, and even product changes designed to induce food packers to shift from glass to metal containers. It prepared a summary of information collected from its sale force detailing the comparative costs of metal and glass containers for processed foods, baby food, soluble coffee, vacuum packed coffee, ovaltine, baking powder, and syrup. Comparable information had already been collected for beer containers, and the intention was to gather further material on prune and apple juices (GX 400A). Studies were made of the use of glass and metal containers in Canada (GX 400), of the metal container's competitive position for packaged syrups (GX 401), of the "market for peanut butter in cans" (GX 402), and of the possibilities of increasing packaging of soluble coffee in metal containers (GX 405, 405A, 406, 407, 408, 409, 410, 411, 412, 413, 414).[13]

[13] These records of Continental's business activities contain such significant statements as: "The purpose of this [freight] allowance is to provide an incentive for packers of instant coffee to switch from glass jars to cans" (GX 405); "That consideration be given to the development and market testing of a small-sized metal container, sufficiently attractive and adaptable for continued use to compete effectively with glass jars for use on household tables" (GX 401); "During the last 20 years

Baby food, consuming an estimated one billion, 608 million containers in 1952, was believed to be divided 60 percent to 40 percent in favor of glass containers (GX 415A). Continental conducted extensive consumer research studies designed to determine what factors induced housewives to favor glass containers and what improvements could be made in metal containers to increase their share of baby food sales (GX 415A, 415B, 416, 418, 419, 419A, 419B, 419C, 420). Continental even developed a new container which it believed might be more competitive than glass in the baby food line (GX 415C, 417). Detailed consideration was given by Continental to potential markets for its containers for wine (GX 421) and tomato catsup (GX 421A). Aerosol cans, which in 1956 consumed 300 million containers (GX 422), were energetically urged as containers for barbecue sauce, chocolate syrup, salad dressings, and whipped toppings (GX 423, 424, 425, 426, 427).

Moreover food processors themselves recognized that metal and glass containers were in competition, since they warned that increases in the price of the containers they were using would induce them to shift to the other kind (Tr. 1541–1547, 2119–2123; GX 773, 775,

---

there has been a large increase in the use of soluble coffee. Up to this time the product has been packed almost exclusively in glass. The Continental Can Company has felt that a considerable portion of this market could be obtained by metal containers, provided a suitable container meeting all technical and economic requirements could be developed" (GX 411); "It was the purpose of this study to gather information on consumer acceptance of a metal versus a glass container for instant coffee products" (GX 412).

776).[14] Hazel-Atlas carefully considered the cost of metal containers in determining its own prices and made comparisons which its representatives in the field were instructed to use to show the favorable cost of glass (GX 774).

The actual competition in which Continental and Hazel-Atlas were engaged, and of which the interchangeability of glass and metal food containers is the keystone, was an integral part of the overall pattern of interindustry competition and is reflected in the activities of the respective trade associations. The records of the Glass Container Manufacturers' Institute (GCMI) include: promotional material designed to increase sales of glass at the expense of metal containers; letters from members of GCMI to its director complaining of competition from metal containers, specifically Continental; studies which indicated areas in which it was believed glass could more effectively compete and capture business from metal container manufacturers; and historical analysis of overall competition between metal and glass containers (GX 1–131, 304, 319–346). The Can Manufacturers Insti-

[14] The Hazel-Atlas documents contained information such as: "Burnham & Morrill [food packers] advised Anchor-Hocking and Armstrong that if the full increase in price was put into effect that it would cut down on the use of glass as it would be too far out of line with the cost of their tin package" (GX 773). "We have found considerable resentment in some quarters over the recent price advance. One of our fountain topping accounts was particularly incensed and said that any business that could be swung over to tin would be fully explored, and if possible the change would be made. This manufacturer packs marshallows, chocolate syrup, walnuts in syrup, cherries and pineapple" (GX 775).

tute conducted comparable activities on behalf of metal containers, in an attempt to enable its members to compete more effectively with glass containers (GX 138, 145, 150, 152, 154, 156, 160, 162, 166; Tr. 1663–1664).

Plainly there is reasonable interchangeability between glass and metal containers in the food canning industry, and there is active competition between the producers of metal and glass containers for the customers of this vast market. Containers for the food canning industry is a line of commerce for Section 7 purposes.

(b) *Effect upon Competition.* The purpose of market share statistics is to assess the importance of the competition being eliminated through the merger by comparing the size of the entire market available or potentially available to purchasers of a product with the portions of that selling market represented by each of the merging companies. Thus if there is an overall production of 100 million units of a product and a company manufacturing 20 million merges with a company producing 10 million, it is useful to note that the merger has involved companies with 20 percent and 10 percent of the market available to purchasers. Where, however, a company's overall productive capacity is readily channeled into any of several similar products, a meaningful practical measure of the company's actual and potential production of any particular product—and thus the touchstone for measuring the competition foreclosed by the merger—is its overall production of all such

similar products, for this is the best practical estimate of the capacity a buyer can call upon to satisfy his needs.

In this case the record and the district court's findings demonstrate that the total productive capacity of metal and glass container manufacturers and sellers is actually and potentially available to food canners. It follows that the narrowing of competitive alternatives for food canners as a result of this merger is best gauged in terms of production of all metal and glass containers, and that the best statistical evidence of the competition between Continental and Hazel-Atlas in the production and sale of containers for food canning is their respective shares of the total production of metal and glass containers—21.9 percent and 3.1 percent (GX 801, table 3a).[15]

The court found, first, that there was no difference between metal and glass containers used for food and nonfood purposes. As illustrative, it noted that "substantially the same open-top can is used for food, pet food, motor oil and other non-food products" (App. 16a); and "the same wide mouthed glass jar is used

[15] The record shows that in 1955, the year prior to the merger, Continental Can shipped about 13 billion units and Hazel-Atlas 1.9 billion units out of the total United States shipments of 59.2 billion units of glass and metal containers. The two other leading firms, with Continental, were American Can Co., 26.8 percent, and Owens-Illinois Glass Co., 11.2 percent. Next were Anchor-Hocking Glass Co., 3.8 percent, and National Co., 3.3 percent, and Owens-Illinois Glass Co., 11.2 percent. Next were metal and glass container companies produced 70.1 percent of the aggregate total, with the remainder divided among hundreds of firms.

percent (GX 801, table 3A). In 1955 therefore the top six

for peanut butter and silver polish, and the same narrow necked glass bottle is used for vinegar and liquid starch" (App. 16a) (see Tr. 335, 341, 366, 1004, 3861–3864). Second, the court found that, regardless of the end use, all metal containers are manufactured by the same processes on the same machines; the same is true of glass containers. Food and nonfood containers are sold through the same channels of trade subject to the same price structure (App. 16a, 17a, 80a). The record further demonstrates that modern glass and metal container manufacturing machinery is capable, with easily-made adaptations, of producing all sizes and shapes of each container, and it is standard industrial practice to make such changes to match customer orders (Tr. 330, 437, 466–468, 1198–1199, 1325–1330, 3963; GX 185, 363, 364; DX K).[16] Thus, the best statistical portrayal of the competitive choice of food canners is provided by the production of metal and glass containers by each of the companies engaged in their manufacture.

The court below found, as a major flaw in the government's case, that it failed to present universe and market share statistics limited to the end use proposed as a relevant market—the production and sale of containers for use by food canners in packing hermetically-sealed, heat-sterilized foods. No such statistics

[16] Although prior to the merger, Hazel-Atlas had only one Hartford-Empire I.S. glass container forming machine capable of producing a full line of containers, it had a substantial number on order, and by 1958, had the third largest number of machine sections in the industry (GX 363, 364, DX K).

appear to be available (see the Census categories, App. 15a). But even if available, they would be unnecessary because, in view of the interchangeability of both plants and products, appellees' market positions in the overall market are the most illuminating guide to the effect of this merger.

In any event, there is no reason to believe that Continental's and Hazel-Atlas' shares of containers used for food canning would be substantially different from their shares of total container production. Food canning is of pervasive importance as an end use for metal and glass containers, consuming approximately 35 percent of all such containers (GX 801, 636). Large companies like Continental and Hazel-Atlas, which compete broadly throughout the industry, can be expected to maintain their share of the business of food canners. This is confirmed by data with respect to shipments of all glass and metal food containers (including but not limited to "canning"), in which the percentages held by Continental and Hazel-Atlas correspond closely to their shares of total production.[17] These figures can be relied upon for "the accuracy of the broad picture presented"; [18] certainly they are sufficient to require the defendants to come forward with their evidence.

By the acquisition of Hazel-Atlas' 3.1 percent of the container market Continental, which already had

---

[17] Continental had 22.7 percent, Hazel-Atlas, 2.8 percent of all glass and metal *food* containers, not limited to hermetically-sealed, heat-sterilized food, as compared to 21.9 percent and 3.1 percent of total production (GX 801, Table 3c).

[18] *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 342, fn. 69.

21.5 percent, increased its share of the market by more than 14 percent. Continental was the second largest manufacturer of containers suitable for food canning, Hazel-Atlas the sixth. The effect of the acquisition was also to increase the total share of the three largest firms, Continental, American Can Co., and Owens-Illinois Glass Co. by about 5 percent of their prior position to 63 percent.[19]

Such an increase in market shares is sufficient to "raise an inference that the effect of the contemplated merger of appellees may be substantially to lessen competition" in the manufacture and sale of containers for food canning, since it "produces a firm controlling an undue percentage share of the relevant market and results in a significant increase in the concentration of firms in that market" (*United States* v. *Philadelphia National Bank*, slip op., pp. 41, 43). While the percentages here are smaller than those in *Philadelphia Bank*, they occur in industries in which oligopoly is far advanced. As this Court explicitly pointed out in *Philadelphia Bank*, "if concentration is already great, the importance of preventing even slight increases in concentration and so preserving the possibility of eventual deconcentration is correspondingly great" (slip op., p. 43, fn. 42). See also *Brown Shoe*, 370 U.S. at 315-316, 333. Moreover, if this

[19] These calculations utilize the market statistics for 1955, the year preceding the merger. The actual post-merger shares, in 1956, turned out to be somewhat lower. Continental had 24.9 percent, an increase of 13.7 percent over its previous position; Continental, American and Owens-Illinois had 61.9 percent, an increase of about 3 percent.

merger is allowed, future similar transactions cannot be prevented (*Brown Shoe*, 370 U.S. at 343–344), and further mergers between metal and glass container manufacturers would have the accelerated anticompetitive consequence of combining two oligopolistic industries. The government has therefore met its burden of showing that the merger was proscribed.

CONCLUSION

This appeal presents substantial questions of public importance. Probable jurisdiction should be noted.

Respectfully submitted.

APPENDIX

No. 28769

Civil 112-387

UNITED STATES DISTRICT COURT
SOUTHERN DISTRICT OF NEW YORK

UNITED STATES OF AMERICA, PLAINTIFF

v.

CONTINENTAL CAN COMPANY, INC. AND HAZEL-ATLAS GLASS COMPANY, DEFENDANTS

OPINION

BRYAN, District Judge:

This is a civil action by the United States to enjoin the proposed acquisition by defendant Continental Can Company, Inc. (Continental) of defendant Hazel-Atlas Glass Company (Hazel-Atlas) on the ground that such acquisition would violate § 7 of the Clayton Act as amended.[1] The court has jurisdiction over parties and subject matter.

The Government had previously attempted to block the acquisition by invoking a consent decree which had been entered against Continental in 1950 in a civil

[1] 15 U.S.C. § 18: "No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no corporation subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another corporation engaged also in commerce, where in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly. • • • "

anti-trust suit under §§ 1 and 2 of the Sherman Act and § 3 of the Clayton Act in the District Court for the Northern District of California. On August 31, 1956 the California court held that the consent decree did not cover the proposed acquisition.[1]

The consummation of the acquisition was delayed in the meantime at the Government's request. The Government then commenced this action. It moved for a preliminary injunction against consummation and sought a temporary restraining order pending the hearing and determination of its motion. The temporary restraining order was denied on September 13, 1956. On that day, Continental took over all of the assets, property, business and good will and assumed all of the liabilities of Hazel-Atlas, which since then has been operated as the Hazel-Atlas Division of Continental.

The Government withdrew its motion for a preliminary injunction on September 18, 1956 and this action became one for divestiture.

After some considerable time, the case was assigned to me for all purposes. Extensive pre-trial proceedings were conducted at which over a thousand pages of transcript were taken. The case then came on for trial.

The Government concluded its case after six weeks of trial during which it called some 78 witnesses. Over four thousand pages of testimony were taken. The Government introduced more than twelve hundred exhibits and the defendants more than five hundred.

At the conclusion of the Government's case defendants, pursuant to Rule 41(b), F.R.C.P., moved for a dismissal on the ground that upon the law and the

---

[1] *United States v. Continental Can Company*, 143 F. Supp. 787 (N.D. Cal. 1956).

facts the Government had shown no right to relief and that they were therefore entitled to final judgment on the merits. The motion was granted in a brief oral decision which stated only the conclusions reached. In view of the importance and complexity of the case a detailed opinion was to follow.

Before that opinion could be filed, the Supreme Court decided *Brown Shoe Co., Inc.* v. *United States*, 370 U.S. 294 (1962), its first decision dealing at any length with § 7 of the Clayton Act as amended in 1950. The Government then asked leave to submit material dealing with the effect of that case on the case at bar. This application was granted and both sides submitted briefs on this question. Consideration of the *Brown Shoe* case has not changed the conclusions which I reached at the end of the trial.

My opinion follows.

Defendants' motion under Rule 41(b) for a dismissal at the close of the Government's case, posed squarely the question of whether on the record, as it then stood, defendants were entitled to judgment.

The motion was made on the ground that "upon the facts and the law the plaintiff has shown no right to relief." In an action tried to the court without a jury, the court, when such a motion is made at the close of plaintiff's case, "as trier of the facts may then determine them and render judgment against the plaintiff or may decline to render any judgment until the close of all the evidence."

There is no doubt as to the meaning and applicability of Rule 41(b). The test to be applied in a case tried to the court alone is quite different from that on a motion to dismiss or for a directed verdict in a jury trial. In the latter case the question is whether or not the plaintiff has made out a prima facie case sufficient to go to the jury and the court must view the evidence in the light most favorable to him.

In a trial to the court alone, however, the court is authorized under Rule 41(b), to evaluate and weigh all of the evidence presented by the plaintiff, draw such inferences therefrom as it considers reasonable in the light of the record, and determine at that stage whether plaintiff has sustained the burden of proof necessary to establish its right to relief were the case to end there. If the court undertakes to make such a determination and concludes that the plaintiff has not met this burden, the defendant is entitled to judgment on the merits.'

In this case, as the trier of the facts, I determined at the conclusion of the Government's case that it had failed to sustain its burden of showing by a preponderance of the evidence that the acquisition under attack violated Section 7 of the Clayton Act in any respect. I therefore directed that judgment be rendered against the Government.

SECTION 7 OF TI CLAYTON ACT IN THE LIGHT OF THE BROWN SHOE CASE

The Government's case is grounded solely on Section 7 of the Clayton Act as amended in 1950. There is no claim of violation or threatened violation of any provision of the Sherman Act. There is no charge of restraint of trade, monopolization or attempt to monopolize. This is strictly a Section 7 case.

Section 7 as amended forbids the acquisition of the stock or assets of one corporation by another "where

Supp. 71 (S.D.N.Y. 1955); *Brahms* v. *Moore-McCormack Lines, Inc.*, 133 F. Supp. 283 (S.D.N.Y. 1955); 5 Moore's Federal Practice p. 1044, et seq. (2d ed. 1951). See also *Blood* v. *City of New York*, 237 F. 2d 855 (2 Cir. 1956).

in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly."[4] The *Brown Shoe* case, decided on June 25, 1962, some twelve years after the 1950 amendment to § 7, is the first definitive interpretation of that section by the Supreme Court since its amendment.

The facts in the *Brown Shoe* case were entirely different from those in the case at bar. The specific holdings of the Court on the facts presented there are therefore not determinative of the problems posed here. Indeed, *Brown Shoe* recognizes that the facts in each case in all likelihood will differ widely, that the framework of each industry is likely to be unique, and that each case must stand or fall on its own facts viewed within the framework of the industry pattern.[5]

However, the discussion in *Brown Shoe* of the legislative history and background of the 1950 amendment to § 7, the theory of the amended section, the interpretation to be given to it, and the principles and guidelines to be followed in applying it, is controlling.[6] *Brown Shoe* is the authoritative declaration of the law on the subject as it now stands and the principles and guidelines which it lays down must be applied here.

Section 7 proscribes acquisition of either stock or assets where, as a result, competition in any line of commerce in any section of the country may be substantially lessened. It covers all mergers or acquisitions, horizontal, vertical or conglomerate.[7]

---

[4] 15 U.S.C. § 18.

[5] *Brown Shoe Co.* v. *United States*, *supra*, pp. 321–322.

[6] The legislative history of Section 7 and the 1950 amendment is reviewed exhaustively in *Brown Shoe* (370 U.S. pp. 311–323). Further general discussion here is unnecessary.

[7] *Brown Shoe Co.* v. *United States*, *supra*, p. 317.

696-226—63——3

As *Brown Shoe* makes plain, however, the section does not prohibit all mergers. While the congressional intent was to arrest restraints of trade and monopolistic tendencies "in their incipiency and well before they have attained such effects as would justify a Sherman Act proceeding,"[8] there is no per se proscription against the acquisition of the stock or assets of one corporation by another. The statute is concerned only with those acquisitions which have demonstrable anti-competitive effects.[9]

It is clear, moreover, that the statute was directed neither at the possibility that anti-competitive effects might occur nor at certainty of anti-competitive effects already covered by the Sherman Act.[10] "[P]roof of a mere *possibility* of a prohibited restraint or tendency to monopoly will not establish the statutory requirement * * *."[11] The statute is concerned with the reasonable probability of the lessening of competition or tendency toward monopoly as a result of the particular acquisition under scrutiny—a showing that such effects are reasonably likely to occur. This is what the words "may be" as used in the statute mean.[12] The lessening of competition, moreover, must also be shown to be "substantial."[13]

Acquisitions are proscribed where substantial anti-competitive effects or tendency to monopoly are reasonably probable in *any* line of commerce in *any* section of the country. Thus, in order to determine whether there are anti-competitive effects or tendency

[12] *A. G. Spalding & Bros., Inc.* v. *Federal Trade Commission*, 301 F. 2d 585 (3 Cir. 1962).

[13] S. Rep. No. 1775, 81st Cong. 2d Sess., p. 3 (1950).

to monopoly, it is necessary in each case to define the lines of commerce in which the acquiring and acquired companies were engaged and the sections of the country affected. Anti-competitive effects and their substantiality cannot be evaluated in a vacuum. They can only be judged in terms of the particular markets or sub-markets affected—that is to say "within the area of effective competition."[14]

While Section 7 does not use the term "market", it is clear that "line of commerce" refers to a product market, and "section of the country" refers to a geographic market in which competition exists and in which the effects of the acquisition may be felt. A relevant product market must be a market which is meaningful in terms of competitive and commercial realities.[15] A relevant geographic market must embrace an economically significant section of the country in terms of competitive effects.[16]

Thus, relevant markets are neither economic abstractions nor artificial conceptions. They are rather specific areas where, viewed in the context of the facts of the particular case under consideration, there may be demonstrable anti-competitive effects as the result of the acquisition. The test then is whether the acquisition has demonstrable anti-competitive effects in any relevant product market in any section of the country.

Section 7 does not spell out any particular tests or standards for determining the revelant product markets or geographic areas which may be affected by the acquisition. Nor does it supply either in quanti-

[14] *United States* v. *E. I. duPont de Nemours & Co.* (General Motors), *supra*, 393.

[16] *Brown Shoe Co.* v. *United States*, *supra*, p. 320.

tative or qualitative terms, any tests for determining whether the effects may be "substantially" to lessen competition. "However, sufficient expressions of a consistent point of view may be found in the hearings, committee reports of both the House and Senate and in floor debate to provide those charged with enforcing the Act with a usable frame of reference within which to evaluate any given merger." [17]

Against this background the tests and standards to be used vary depending upon what may be appropriate in the light of a wide variety of factors. These factors include the nature, business and relationships of the acquired and acquiring companies, the markets which they serve, the kind and extent of competition in such markets, the pattern of the industry as a whole and the place of such companies in the industry.

Thus, in determining relevant product markets it has been deemed pertinent to examine such factors as the peculiar uses and characteristics of the product; its distinguishing physical characteristics; whether it is sold to distinct classes of customers; distinct price differentiations; sensitivity to price changes; reasonable interchangeability of use and demand; public or industry recognition of the market as a separate market entity; unique production facilities; and specialized vendors.[18]

In determining the geographic market pertinent factors include scale of distribution; locale of actual and potential buyers and of competing sellers; focus of

[17] *Brown Shoe Co.* v. *United States*, *supra*, p. 315.

[18] *Brown Shoe Co.* v. *United States*, *supra*; *United States* v. *E. I. duPont de Nemours & Co.* (General Motors), *supra*; *Crown Zellerbach Corporation* v. *Federal Trade Commission*, *supra*; *United States* v. *Bethlehem Steel Corporation*, 168 F. Supp. 576 (S.D.N.Y. 1958).

competition; and whether regional markets interlock to form a larger market.[19]

None of these factors are conclusive in themselves and all must be "functionally viewed, in the context of [the] particular industry."[20] Mere mechanical or quantitative application of § 7 should be avoided and each case must be judged in the light of its own peculiar facts. Only within such a setting can the probable anti-competitive effects of a merger be judged.[21]

In the light of these considerations the issues on which the Government had the burden of proof here were twofold. First, it was required to delineate the relevant product markets or sub-markets in which it claimed that competition was adversely affected by the acquisition and the sections of the country affected. Second, it had to establish that in one or more of such markets or sub-markets in any particular section or sections of the country, there was reasonable probability that the effect of the acquisition would be substantially to lessen competition or to tend to create a monopoly.

II

THE MERGING COMPANIES

(1) Continental

Continental Can Company, Inc. is a New York corporation with its principal offices in New York City. It was organized in 1913 by the merger of three com-

[19] *Brown Shoe Co.* v. *United States*, *supra*; *A. G. Spalding & Bros., Inc.* v. *Federal Trade Commission*, *supra*; *United States* v. *Bethlehem Steel Corp.*, *supra*.

[20] *Brown Shoe Co.* v. *United States*, *supra*, pp. 321–322.

[21] *Brown Shoe Co.* v. *United States*, *supra*, p. 340.

panies engaged in the manufacture of metal cans.[22] At that time American Can Company was the dominant factor in the can industry.

After its organization Continental went through a period of substantial internal expansion. Beginning in 1923 and for the next twenty years it continued to expand internally and also by acquiring some twenty-four companies in various sections of the country which were also engaged in manufacturing various types of cans, some of which had not been previously manufactured by Continental. It also acquired several companies which did not produce metal cans but made other packaging products. Continental acquired its last can manufacturer in 1944.

Since that time it has engaged in a program of diversification aimed at increasing the variety of products which it is able to supply.

Its acquisitions have included companies producing can manufacturing and can closing machinery, flexible packaging, plastic containers and other plastic products, paper containers and paperboard, fibre drums, crown caps and vacuum closures, and a miscellany of other products.

In 1956 it acquired Hazel-Atlas, Robert Gair Company, Inc., a manufacturer of paperboard and similar products, and White Cap Company, which manufactured vacuum type metal closures.

By that time it was and had been for a good many years the second largest metal can manufacturer in the country. It was a formidable competitor of American Can Company which had long been the leader in the industry.

---

[22] The three original companies were Continental Can Company, a New Jersey corporation; the Export and Domestic Can Company, a New York corporation; and the Standard Tin Plate Company, a Pennsylvania corporation.

When it acquired Hazel-Atlas Continental's principal business was the manufacture and sale of metal cans and other metal containers to industrial consumers for a wide variety of uses. In 1955 metal cans and other metal containers accounted for between two-thirds and three-quarters of its total dollar sales volume. It also manufactured numerous other products, including fibre drums, flexible packaging materials, plastic products (including plastic containers), paper cups and plates, crown caps, vacuum type metal caps, can closing machinery, and special defense items.

By 1955 Continental had 72 plants for the manufacture of its products at various locations throughout the United States. It also had plants in seven foreign countries, including Canada; forty, manufactured metal cans. Approximately 45,000 persons were in its employ.

Its net sales and operating revenues and net income for the years 1953, 1954 and 1955, in thousands of dollars, were:

	Net sales and operating revenues	Net income
1953	$554,436	$15,680
1954	616,163	20,736
1955	666,266	24,172

Its total assets as of December 31, 1955 were $381,917,000.

Including the Hazel-Atlas, Gair and White Cap acquisitions, for the year 1956 Continental had net sales and operating revenues of $1,010,268,000, and net income of $43,143,000, with total assets as of December 31, 1956 of $633,706,000.

Comparative 1955 combined figures for these four companies prior to acquisition, show net sales and

operating revenues of $929,428,000, net income of $38,693,000, and total assets as of December 31, 1955 of $568,850,000.

(2) Hazel-Atlas

Hazel-Atlas was a West Virginia corporation with its principal office in Wheeling, West Virginia. It was organized prior to 1900 and, as a result of its acquisition by Continental, was dissolved on September 21, 1956.

Its principal business was the manufacture and sale of glass containers of various types to industrial consumers and of glass jars for home canning, both largely of the wide mouthed variety. It also manufactured glass tumblers, tableware, kitchenware, glass articles of special design for industrial use, screw type metal closures and closures for home canning glass jars. It appears to have been the third largest glass container manufacturer in the United States.

Hazel-Atlas operated plants at thirteen locations in various parts of the country, principally in the western Pennsylvania, West Virginia and eastern Ohio area, and had six warehouses. Its net sales and net income in 1953, 1954 and 1955, in thousands of dollars were:

	Net sales	Net income
1953		
1954	$79,280	$3,132
1955	79,174	3,629
	79,930	3,993

Its total assets as of December 31, 1955 were $37,884,000.

After acquisition by Continental the operations conducted by Hazel-Atlas were continued by the Hazel-Atlas Division of Continental and its operating

figures were included in Continental financial statements. It does not appear that there was any substantial change in the volume or character of business done by the Hazel-Atlas Division in the period between its acquisition and the trial.

Prior to its acquisition Hazel-Atlas did not manufacture or sell metal cans, plastic or paper containers, vacuum type metal closures, crown caps or any other product manufactured or sold by Continental or its subsidiaries.

On the other hand, Continental did not, directly or through subsidiaries, manufacture or sell glass containers or any other glass products, screw type metal closures, or any product manufactured or sold by Hazel-Atlas. It is uncontroverted that the two merging companies manufactured and sold no identical products.

III

THE TYPES OF PRODUCTS AND THE SEPARATE INDUSTRIES INVOLVED

This case is concerned with three basic types of containers: those made of metal, glass and plastic. They are of a variety of shapes, sizes and end uses.

The three types of containers are produced by three recognized separate industries, each with its own structure and pattern, the metal can industry and the plastic container industry in which Continental was engaged, and the glass container industry in which Hazel-Atlas was engaged.[23]

[23] It may be noted that reference will be made to what is claimed to be an all encompassing "packaging industry." However, as will be pointed out, the evidence wholly failed to establish that there is any such relevant product market in this case. Nor was it established that there is any recognized separate industry or relevant product market comprising all metal, glass and plastic containers, or any general combinations of them.

In addition to the three types of containers the case also is concerned with three different kinds of metal closures used to close or seal products packed in containers. They are crown caps, vacuum type closures and screw and lug type closures. Continental produced crown caps and vacuum type closures and Hazel-Atlas produced screw and lug type closures. Closures will be discussed separately though there is no separate metal closure industry.[24]

(1) Basic types of products

(a) *Metal cans*

For Census Bureau statistical purposes the metal can is defined "as a single-walled container constructed wholly of tin plate, terne plate, blackplate or waste plate designed for packing products."[25] Such cans have distinct physical characteristics. They are rigid and unbreakable, but can be dented. Unlike plastic containers, they can be hermetically sealed and are impermeable to gases. They can be heat processed faster and are lighter than glass containers, and are not chemically inert.

The basic raw material used in can manufacture is tin-coated steel (tin plate), but some cans are made from uncoated steel (blackplate) or aluminum. Other raw materials include soldering compounds, paints, varnishes, lithographing inks, paper and cartons for packaging. The major factor in determining can prices is the cost of tin plate. Cans are generally sold f.o.b. the manufacturer's plant.

[24] See discussion *infra* pp. 27a–30a. [The court's references to its own opinion have been renumbered to the pagination of this appendix.]

[25] G–1203. This definition excludes steel pails which are defined as "single-walled shipping containers having capacities of 1–12 gallons inclusive that are cylindrically constructed of steel sheet of 29 gauge and heavier."

The products packed in metal cans are extremely numerous and varied and in fact cover a substantial segment of American industrial and agricultural production. However, for statistical purposes the Census Bureau has set up thirteen different general categories of metal cans all in terms of end use. The Bureau collects statistics from metal can manufacturers as to the amount of metal each consumes in the manufacture of cans in each of these categories.[26]

The thirteen Census Bureau and use categories are fruit and vegetables (including juice); evaporated and condensed milk; other dairy products; meat (including poultry); fish and seafood; coffee; lard and shortening; soft drink; beer; pet food; oil open-top (1 quart and 5 quart); all other food (including soup and baby food cans); and all other nonfood.[27] A number of these categories plainly include a great number and variety of specific end uses for which no accurate further breakdowns are available.

Among the principal types of cans are "Packers" cans and "General Line" cans. "Packers" cans are normally used for food products though they are used

[26] Under the regulations of the Bureau metal can manufacturers report the number of base boxes of steel consumed in the manufacture of cans in each category. A base box is a unit of area measurement. The Bureau does not prescribe which specific end products fit into each category and this is left to the discretion of the individual reporting manufacturer.

The base box figures so reported are then converted by the Bureau into short tons of steel on the basis of conversion factors for each category. The comparative production figures in this record are those based on short tons of steel used in the production of metal cans reported by manufacturers as belonging in the various census categories of metal cans shipped.

There are no published figures of the actual number of cans shipped and there are wide differences in the product mixes in terms of sizes of cans produced by the various manufacturers.

[27] G–1203.

for many nonfood products as well. They are round open-top or sanitary cans. The packer after filling the can puts the top on.

"General Line" cans are used both for food and nonfood products and have different kinds of fittings and different shapes. There are other types of cans also. All types of cans are manufactured from the same raw materials by the same production processes and with the same equipment.

Cans used for one type of product may be used for other types of products also, but they usually have different linings for different products. For example, substantially the same open-top can is used for food, pet food, motor oil and other non-food products.

(b) *Glass containers*

There are two basic types of glass containers, the wide mouth and the narrow neck container.

Glass containers have distinct physical characteristics. They are rigid, chemically inert and impermeable to gases; can be hermetically sealed but are readily broken; and, unlike many cans, can be easily resealed after they have been opened. Glass containers are heavier than other types of containers and must be carefully packed for shipment to avoid breakage. Costs of shipment are therefore higher. They take longer to heat process than cans. Many narrow necked glass containers are suitable for re-use by bottlers and are returned by consumers to the bottler for such re-use.

Glass containers used for one type of product are often identical with containers used for widely dissimilar products. Thus, the same wide mouthed glass jar is used for peanut butter and silver polish, and the same narrow necked glass bottle is used for vinegar and liquid starch.

The basic raw materials used in the manufacture of glass containers are sand, lime and soda ash. Also required are the necessary labeling and coloring materials. Because of the need for careful packing for shipment to customers, corrugated cartons are used to pack the containers.

Cost of labor is the major factor in determining glass container prices. The corrugated shipping container represents 18–20% of the cost of the final product as shipped. Glass containers are generally sold on a delivered price basis with freight included in the price.

The Census Bureau publishes data as to glass contained shipments. These statistics are grouped, in terms of end use, in the following fourteen categories:[28]

Narrow Neck: Food; medicinal and health supplies; household and industrial; toiletries and cosmetics; beverage, returnable; beverage, non-returnable; beer, returnable; beer, non-returnable; liquor; and wine.

Wide Mouth: Food, including fruit jars and jelly glasses; medicinal and health suplies; household and industrial; toiletries and cosmetics; dairy products; and packer's tumblers.

---

[28] The statistics are collected for the Bureau by the industry trade association, the Glass Container Manufacturers Institute, from its member manufacturers and are used as the industry totals. A number of manufacturers are not members of the Institute. Statistics are prepared on a physical volume basis measured in gross. They show container shipments by product groups as classified by the Institute with a basic division between narrow neck and wide mouth containers. It may be noted that the Institute's descriptions of the different end use categories (G–1205) are slightly different from those which Census apparently used. The Government relied on the latter, however, and I have used them here.

Each of these general end use categories is composed of hundreds of individual end use items. But no detailed breakdown figures on the end use categories are available.

(c) *Plastic containers*

Plastic containers are manufactured by various methods including blow molding and injection molding. They are made of such raw materials as polyethylene and polystyrene. Prices are principally determined by the price of raw materials. Some are sold on a delivered price basis and some are not.

Plastic containers have distinct physical characteristics. They are neither rigid nor transparent. They are not impermeable to gases, and cannot be hermetically sealed. Such containers are virtually unbreakable, but they cannot contain internal pressure and their ability to hold a vacuum is limited. They are lighter in weight than glass containers and appear to be smaller than glass containers of equal capacity. They are electrostatic and therefore attract dust.

Plastic containers are of many shapes and sizes and include such items as bottles, jars, tubes, vials, and bags. They are used to package many kinds of foods, drugs, cosmetics, detergents and industrial products including such widely diverse products as rust removers, baby lotions, ice cream, insect repellents, shoe polishes, pills, water, and deodorants.

(2) Separate industries

(a) *The metal can industry*

This industry is composed of companies engaged in the manufacture of metal cans used to pack a large number and wide variety of different products. Most of the companies in the industry manufacture cans for sale to industrial and agricultural processing

customers who, in turn, use them to pack their own products for marketing. Some companies, on the other hand, the so-called captive companies, produce cans for their own use in packing their own products.[29] Some of the captive companies produce cans for their own use and also sell to other users.[30]

A number of metal can manufacturers also manufacture tinware and other tinplate products. Some also produce other kinds of packaging materials and incidental items.

There are no reliable figures in the record as to the number of companies engaged in the manufacture of metal cans in the United States. Estimates run from seventy-five to over ninety. The largest is American Can Company. Continental is second. Either Campbell Soup (a captive manufacturer) or National Can Company is third. Other important manufacturers include Crown Cork & Seal Company, Heekin Can Company, J. L. Clark Company, Carnation Milk and Sherwin-Williams. American Can, Continental, National Can and Crown Cork & Seal, among others, sell cans throughout the country. Most of the other companies operate on a regional basis.

American Can, the industry leader, like Continental, manufactures a variety of products used by packers. In addition to metal cans it produces fibre, plastic and paper containers. It also manufactures machines for filling and closing both metal and fibre containers. Various other companies manufacturing metal cans also have diversified product lines.

In 1955 American Can shipped approximately 38% of the metal cans sold in the United States. Con-

[29] Such companies include Campbell Soup Company, H. J. Heinz Company, Hollingshead Corporation, Pet Milk Company and Otoe Food Products Company.

[30] Among these are Armstrong Paint Company, Sherwin-Williams Company, The Borden Company and Carnation Milk.

tinental's shipments amounted to approximately 33%. American's shipments exceeded Continental's in nine of the thirteen Census categories. Together these two companies accounted for approximately 71% of the total metal can shipments in the country.

It appears that can companies sell their products directly to users. There is nothing to indicate that there are any jobbers or wholesalers who purchase cans for resale to their own customers and it may be assumed that there are none.

The trade association for this industry is the Can Manufacturers Institute. Its forty-nine members, limited to can manufacturers, include American, Continental, National, Crown, Heekin and Clark. Voting rights and representation on the Board are determined by the number of employees of the member companies.

The Institute has a professional staff of three. Its activities, carried on largely through committees, deal with various technical industry problems such as industrial relations, traffic, safety and research and include a limited amount of promotion on the advantages of the metal can.

A promotion and advertising program, jointly financed by the members of the Institute and tin plate manufacturers who supply raw materials for can manufacture, was carried on at one time. The program was dropped when the tin plate manufacturers withdrew financial support. A recent program of advertising to promote soft drinks in cans was not conducted by the Institute but was financed exclusively by tin plate manufacturers.

Since 1957 the Institute has done no advertising and its only promotion work has been in connection with the celebration of the sesquicentennial of the tin can. The extent of the activities of the Institute and the effects, if any, which such activities may have upon

the industry or upon the public are not reflected in the record.

The annual production of cans has increased substantially since the end of World War II when the industry resumed its normal rate of growth after wartime curtailment of metal supply. Its facilities have also expanded substantially and continue to do so.

Since 1950 American and Continental have substantially maintained their market positions as the number one and number two companies in the industry respectively. However, the medium sized producers, with assets of less than $100,000,000 have not only participated in the growth of the industry but have increased their share in the market. The evidence did not show that there has been any reduction in the number of companies manufacturing cans since the Hazel-Atlas acquisition and, in fact, the number of companies engaged in the "Tin Can and other tinware industry"[31] was greater in 1957 than in 1950.

It did not appear that the initial capital investment needed to embark upon can manufacture is unreasonably high, that there is any obstacle to obtaining whatever technical knowledge is necessary or that there are any patent barriers to entry into the industry. Raw materials are plentiful and readily available.

There was little in the record as to the shape and pattern of the industry in terms of such factors as the markets which it serves, the nature of the competition which exists in such markets, pricing practices, its methods of buying, selling and merchandising, the supply and demand picture or similar matters.

From all that appears the industry is prosperous, healthy and highly competitive. Competition has been and remains keen and vigorous. What the

[31] This is an Internal Revenue Service classification.

record presents is a generalized picture of a large, strong, and relatively stable but expending metal can industry.

(b) *The glass container industry*

This well-defined and recognized separate industry is composed of companies engaged in the manufacture of glass containers sold to industrial and agricultural customers for use in packing their own products. Glass containers are also sold to the public for home preserving.

The industry produces glass containers of a wide variety of types, shapes, sizes and colors for numerous end uses. A number of companies, including Owens-Illinois Glass Company and Hazel-Atlas, also produce glass table and kitchen ware and other glass products. Some also produce other products used by packers.

There are at least forty-two companies engaged in the manufacture of glass containers. By far the largest is Owens-Illinois Glass Company with almost 35% of the total production and with annual sales in 1955 of some $370,000,000 and earnings of some $27,000,000.[32] Anchor-Hocking Glass Company, Hazel-Atlas and Knox Glass, Inc. appear to follow in that order. The Hazel-Atlas share of the glass container market in 1955 was about 9.6% with net sales of some $79,000,000 and net earnings of approximately $3,000,000.

Owens-Illinois, in addition to glass containers, manufactures plastic containers, metal and plastic clo-

[32] These figures apparently include all of the products manufactured by Owens-Illinois and are not confined to glass container sales. The Hazel-Atlas figures are also inclusive but Hazel-Atlas, unlike Owens-Illinois, did not have widely diversified product lines.

sures, corrugated shipping containers, various types of fibre and paperboard containers, closure machinery and a wide variety of other glass and plastic products. Other companies, such as Anchor-Hocking, also have diversified lines.

There are at least twenty companies in the industry with sales above or in the neighborhood of $10,000,000 a year. Most of these companies have been expanding their facilities and production and increasing sales at a rapid rate. There is nothing to indicate that smaller companies are not also prospering.

Five companies in the industry sell throughout the country. They are Owens-Illinois, Anchor-Hocking, Thatcher Glass Mfg. Co., Ball Bros. Co., Inc., and Hazel-Atlas. Other companies sell on a regional basis.

The trade association for the industry is the Glass Container Manufacturers Institute. Its membership consists of thirty-six glass container manufacturers, six closure manufacturers and twenty suppliers of raw materials and equipment.[33] Dues are assessed on the basis of sales volume and the Board of Trustees is composed of employees of the member companies.

The Institute has about forty-five paid employees. Its activities are carried on by standing committees. Members of the professional staff are assigned to each committee.

Activities include market research and promotion, the collection and dissemination of statistics concerning the industry, technical research, package design and specifications, the development of standard testing and quality control procedures, problems of freight rates, labor relations, and liaison work with govern-

[33] A number of manufacturers are not members of the Institute, including Star City Glass Co., Wheaton Glass Co., T. C. Wheaton Co., Kerr Glass Manufacturing Co., Underwood Glass Co., Arkansas Glass Co., and Gallo Glass Co.

ment. The Institute does advertising and publicity for the industry but the evidence does not indicate how substantial this is or how effective such activities are.

As in the case of the metal can industry, there is virtually nothing in the record of significance regarding such matters as the markets served by the industry, the nature of the competition which exists in such markets, the problems faced by its customers, methods of selling and merchandizing, price structure or pricing practices, the supply and demand picture, or similar matters.

During World War II the tin plate supply was greatly curtailed and the glass container industry was able to make substantial advances at the expense of the metal can industry. Since the war the glass container industry has continued its substantial growth and expansion and this process has not abated since the Hazel-Atlas acquisition. The growth of the glass industry has been more rapid than that of the can industry.

Numerous technical improvements have been made in the glass container which have increased its strength, resistance to breakage and overall utility, and have lightened weight. These improvements have contributed significantly to the growth of the industry.

There appears to be no difficulty in entering the glass container industry and a number of new companies have recently entered and have had successful operations. There has been a continuous expansion of facilities by both large and small companies through new plant construction or additions to existing plants.

There was no evidence that the initial capital investment needed to enter the industry was unreasonably high or that there is any obstacle to obtaining whatever technical knowledge or facilities are neces-

sary. Nor are there any patent barriers to entry. Raw materials are plentiful and readily available, as are shipping containers.

The industry is prosperous, healthy and highly competitive. Here again is a generalized picture of a large, strong, and rapidly expanding industry in which competition has been and remains keen and vigorous.

(c) *The plastic container industry*

The plastic container industry is relatively new. It got under way in the mid 1940's. The industry has since grown rapidly and is still undergoing rapid expansion. Neither the size and scope of the industry nor the respective positions of Continental and other manufacturers in it can be determined with any reasonable degree of accuracy from the evidence in this record.

The larger companies in the industry include Plax Corporation, Injection Molding Company, American Can, Continental, Royal Manufacturing Company, Inc., Owens-Illinois, Wheaton Plastics Company and Foster-Grant Company, Inc.

The dollar sales volume of the industry is small compared with that of the metal can and glass container industries. Plax, the largest producer, had plastic container sales in 1959 of about $12,000,000, which it estimated to be 30% to 40% of such sales in the United States.

In 1955 Continental's sales of plastic containers amounted to $2,400,000, and according to its estimate it shipped approximately 9.3% of the plastic squeeze bottles sold in the United States in that year.

There are apparently thousands of small companies engaged in the manufacture of plastic containers.

Some use the blow molding method of manufacture and others use injection molding.

Among the many types of plastic packaging materials produced by companies in the industry are bottles, jars, vials, boxes, folding cartons, tubs, tubes, carboys, tubes with metal ends, film and other flexible materials and bags. These containers are sold to a wide variety of industrial customers who pack their own products.

There is a Plastic Bottle and Tube Manufacturers Institute, organized in 1957, which is a division of the Society of the Plastics Industry, Inc. Its members are American Can, Continental, Foster-Grant, Injection Molding, Plax and Royal.

There was a paucity of information in the record about the activities of this Institute. It appears to collect statistics from its members, some of which apparently are published by the Department of Commerce but these figures are not in the record. Such statistics as are collected by the Institute concerning individual companies are destroyed when received and only overall totals are maintained. The Bureau of Census does not collect or publish statistics relating to the production of plastic containers.

There is no showing that the initial capital investment needed to enter manufacture of plastic containers is high. Nor are there any technical obstacles to such manufacture. Raw materials and labor are readily and plentifully available and patents constitute no barrier to entry into this field.

The number of companies manufacturing plastic containers is on the increase and has continued to increase since the acquisition. The industry is rapidly expanding and competition is keen and vigorous. There are no universal figures for the industry in the record and such statistics as there are concerning it

are wholy unreliable and furnish no basis from which informed conclusions can be drawn.

This relatively new and expanding industry plainly has substantial potential. However, its overall dimensions and the extent to which it may be in competition with the glass container and metal can industries remain, at best, obscure.

(3) Closures

The term "closures" refers to a miscellany of devices used by packers to close and seal containers in which products are packed. The various types include crown caps, vacuum type closures, screw and lug type closures, paper and foil caps, and closures for home canning. Some are made of tin plate, some of aluminum or plastic, and others of paper or foil.

As I mentioned earlier, prior to the acquisition Continental produced crown caps and, after acquiring White Cap Company, vacuum type metal closures as well through that subsidiary. Hazel-Atlas did not manufacture either of these products. It manufactured screw and lug type metal closures and home canning closures. Continental did not.

(a) Crown caps are made of tin plate with cork or composition lining. They are used to close narrow neck glass bottles, primarily for beer and carbonated beverages. They are applied to the bottle by crimping and not by lugs or threads. They are not sold in competition with screw or vacuum type metal closures.

The largest producer of crown caps was Crown Cork & Seal Company, which was also a metal can producer. Other producers, in addition to Continental, were Armstrong Cork and Guttman. Though Anchor-Hocking and Owens-Illinois did not manufacture crown caps at the time of the acquisition, both

of them had been for some time large manufacturers of beer bottles and beverage bottles.

In 1956 Continental shipped 17.1% of the crown caps sold in the United States, in 1957 18.4% and in 1958 18.5%.

(b) Vacuum type metal closures are made of tin plate or aluminum, with various kinds of linings. They may be of the side-seal, top-seal (or twist-off) or roll-on varieties. They are used on glass containers almost entirely for packing food.

Vacuum type metal closures are applied by closing machines which create a vacuum in the head space of the container. The products to be packed are sterilized and steam is inserted into the area remaining between the food and the top of the jar, thus exhausting the air in the head space. The closure is then applied and when the product cools and the steam evaporates a vacuum seal is created.

Closing machines for the application of vacuum metal closures are leased or sold to packers by Continental through its White Cap Division and also by Owens-Illinois, Anchor-Hocking and Aluminum Company of America. Vacuum closing machines for a particular type of vacuum closure made by different manufacturers, are interchangeable with similar machines made by other manufacturers, or may be made so with relatively minor modifications. Such machines cannot be used to apply screw type metal closures and they operate at much higher speeds than machines for the application of screw type closures.

The White Cap Company, now a subsidiary of Continental, is the leading manufacturer of vacuum type closures. Other manufacturers include Anchor-Hocking, Owens-Illinois and Crown Cork & Seal. In 1956 White Cap produced approximately 60% of the vacuum closures made from tin plate. A recent

development, apparently pioneered by White Cap, is the twist-off vacuum closure which is used for the same general purposes as other vacuum closures.

(c) Some screw and lug type metal closures are made of tin plate with various kinds of linings. Others are made of aluminum or plastic. It does not appear that screw and lug type closures made of different materials have end uses substantially different from one another. Closures of this type are normally used on glass containers.

These closures engage the glass container by screwing into continuous threads in the neck of the container. They cannot be used where a vacuum is required and in general are not used for food products for which vacuum metal closures are needed because of spoilage problems. Screw and lug type closures are used on both food and non-food products.

There are at least 18 companies manufacturing screw and lug type metal closures, including Owens-Illinois, Crown, Ball Bros. and Hazel-Atlas. In 1958 Hazel-Atlas produced approximately 4.7% of the screw and lug type metal closures shipped in the United States. There are several companies, including Owens-Illinois, which manufactured both metal and plastic type screw and lug type closures, the uses of which appear to be substantially interchangeable. From 24 to 36 companies make plastic screw type closures.

The statistics in the record relating to closures do not include metal closures used in home canning, aluminum closures, plastic closures or paper caps, though Hazel-Atlas made home canning closures as well as screw and lug type closures for commercial packing. With the exception of home canning jars sold with closures attached, glass containers and closures for them are sold separately. Closures are

sold by the manufacturer directly to packers and there appear to be no wholesalers or jobbers of these products. Closure customers generally have multiple sources of supply. There is no evidence that prices of one type of closure have any effect on the sales volume of any other types.

There is no shortage of raw materials necessary to manufacture closures. There was no showing that there were any substantial obstacles to entry into any of the closure fields.

Crown caps, vacuum type closures and screw and lug type closures have in the main quite different uses and do not significantly compete with one another. However, competition within each of the respective screw type, vacuum type and crown cap fields has been and remains keen and vigorous and there does not appear to have been any significant diminution in the number of companies engaged in these respective fields either before or after the acquisition.

IV

THE CONTENTIONS OF THE PARTIES

(1) Lines of commerce and sections of the country claimed to be relevant

A year and a half before the commencement of the trial, the Government, in answer to defendants' interrogatories, specified with particularity ten separate lines of commerce which it claimed were adversely affected by the acquisition under attack. The lines of commerce so specified remained unchanged throughout the exhaustive pre-trial proceedings in which the issues to be tried were carefully limited and defined, and during the six weeks of the trial itself.

The ten lines of commerce are as follows:[34]

1. The packaging industry.
2. The can industry.
3. The glass container industry.
4. Metal closures.
5. Containers for the beer industry.
6. Containers for the soft drink industry.
7. Containers for the canning industry.
8. Containers for the toiletries and cosmetic industry.
9. Containers for the medicine and health industry.
10. Containers for the household and chemical industry.

The Government contended that the relevant geographic market in which adverse effects of the acquisition were felt in each of these ten lines of commerce was the United States as a whole. It contended also that in lines of commerce numbered 2, 3, 5, 6, 7, 8, 9 and 10 there were adverse effects in two separate sections of the country, as well, (a) the United States east of the Rocky Mountains, and (b) the United States west of the Rocky Mountains.

No discussion of the attempted distinction between the areas east and west of the Rocky Mountains is necessary here. The evidence wholly failed to establish that, in the context of this case, there were any differ-

[34] The lines of commerce are listed here in what seems to me to be the logical order in which they should be discussed. The order in which they were listed by the Government in its interrogatories, which I followed in my oral decision, was as follows:

1. Containers for the canning industry. 2. Containers for the beer industry. 3. Containers for the soft drink industry. 4. Containers for the toiletries and cosmetics industry. 5. Containers for the medicine and health industry. 6. Containers for the household and chemical industry. 7. The can industry. 8. The glass container industry. 9. Metal closures. 10. The packaging industry.

ences between these areas or between either of them and the United States as whole indicating that they constituted economically significant separate geographic markets in any of the lines of commerce specified. Nor was there evidence that such effects of the acquisition as might be felt were any different in different sections of the country. The only "section" of the country which was relevant was the United States as a whole. That is the geographic market with which we are concerned here.

The defendants agreed with the Government that the can industry and the glass industry were separate lines of commerce for Section 7 purposes. They contended, however, that the other eight lines of commerce specified did *not* in fact exist and that there were no such separate relevant product markets or sub-markets.

Hazel-Atlas, said the defendants, was engaged in two lines of commerce, glass containers and screw and lug type metal closures and these were the only relevant markets in so far as it was concerned. They said further that the only relevant product markets in which Continental was engaged were metal cans, plastic bottles, crown caps and vacuum type closures.

Thus defendants contended that there were but six separate and distinct relevant lines of commerce or product markets. Moreover, they took the position that the lines of commerce in which Hazel-Atlas and Continental were respectively engaged, were quite different and did not overlap to any significant degree.

(2) Claims as to anti-competitive effects

The Government conceded that it had no proof that any person or firm, seller or buyer, suffered any actual injury as a result of this acquisition, although the trial took place more than three and a half years

after it occurred. There were no complaining witnesses. None of the 78 witnesses whom the Government placed on the stand testified to any actual anti-competitive effects or tendency to monopoly. There was no evidence of actual anti-competitive effects or tendency to monopoly in this record.

The Government's case was predicated upon what it claimed were potential anti-competitive effects.

As its standards for determining whether such effects were reasonably probable, the Government advanced four criteria referred to in the House Report on the 1950 amendment to the section.[35] It claimed that the acquisition (1) had eliminated in whole or in material part the competitive activity of Hazel-Atlas which had been a substantial factor in competition with Continental; (2) had increased the relative size of Continental to such point that its advantage over its competitors threatened to be decisive; (3) had resulted in an undue reduction in the number of competing enterprises; and (4) had established relationships between buyers and sellers which deprived their rivals of a fair opportunity to compete.

The Government also stressed a statement in the Senate Report on the 1950 amendment that the statute was intended "to cope with monopolistic tendencies in their incipiency and well before they have attained such effects as would justify a Sherman Act proceeding * * *."[36] It emphasized prior acquisitions by Continental of companies in the metal can and other fields, and urged that when Continental acquired Hazel-Atlas, the process of acquisition had reached a stage where it was reasonably probable that anti-competitive effects would occur and that the acquisition was therefore unlawful.

---

[35] H.R. Rep. No. 1191, 81st Cong., 1st Sess., 8.

[36] S. Rep. No. 1775, 81st Cong., 2nd Sess. 4.

The Government took the position that, while the anti-competitive effects referred to in the House Report might not be apparent presently, it was probable that they would occur in the future in each of the lines of commerce which it attempted to delineate.

Defendants, on the other hand, while conceding that the criteria referred to in the House Report might be relevant considerations in an appropriate Section 7 case and that, in appropriate circumstances, a continuing process of cumulative acquisition might become unlawful, insisted that there was no substitute for a showing that there be reasonable probability of substantial anti-competitive effects or tendency to monopolize in the product markets relevant to the case under consideration. They pointed out that the intention of Congress to cope with restraints of trade and monopolistic tendencies in their incipiency was carried out by the concept of reasonable probability embodied in the statute and that this was the sole standard to be applied to the particular facts of each case.

Defendants also pointed out that Section 7 cannot be applied mechanically or quantitatively but that each case must be decided on its own facts. They maintained, moreover, that in any event, the Government could not prevail since there was a complete failure of proof here.

They urged that Hazel-Atlas and Continental did not compete with one another to any significant degree and there was no reasonable probability that they ever would; that the merger was utterly devoid of anti-competitive significance; and that it had not resulted and there was no probability that it would result in any substantial lessening of competition or tendency toward monopoly in any of the lines of commerce

delineated by the Government or in any other lines of commerce.

V

UNCOMMON FEATURES OF THE CASE

This case does not fit into any of the classic anti-trust patterns. It deals with three separate and distinct industries manufacturing separate and distinct types of products.

As the earlier discussion indicates, each type of container is made from different raw materials and each has different physical characteristics and properties. Different plant and machinery are required for each and the processes of manufacture are different. The different types of containers manufactured by these different industries are of wide varieties of sizes and shapes and are put to hundreds, if not thousands, of different end uses.

Concededly there was substantial and vigorous inter-industry competition between these three industries and between various of the products which they manufactured. Metal can, glass container and plastic container manufacturers were each seeking to enlarge their sales to the thousands of packers of hundreds of varieties of food, chemical, toiletry and industrial products, ranging from ripe olives to fruit juices to tuna fish to smoked tongue; from maple syrup to pet food to coffee; from embalming fluid to floor wax to nail polish to aspirin to veterinary supplies, to take examples at random.

Each industry and each of the manufacturers within it was seeking to improve their products so that they would appeal to new customers or hold old ones. Hazel-Atlas and Continental were part of this overall industrial pattern, each in a recognized separate industry producing distinct products but en-

gaged in inter-industry competition for the favor of various end users of their products.

It does not necessarily follow from this, however, that the acquisition of Hazel-Atlas by Continental falls within the ambit of Section 7 of the Clayton Act. That section of the act deals specifically with relevant product markets and the lessening of competition within them. The fact that there is inter-industry or inter-product competition between metal, glass and plastic containers is not determinative of the metes and bounds of a relevant product market. As the Supreme Court said in the *Cellophane* case:[37]

> Determination of the competitive market for commodities depends on how different from one another are the offered commodities in character or use, how far buyers will go to substitute one commodity for another. For example, one can think of building materials as in commodity competition but one could hardly say that brick competed with steel or wood or cement or stone in the meaning of Sherman Act litigation; the products are too different. This is the interindustry competition emphasized by some economists. See Lilienthal, Big Business, c. 5.[38]

Thus the relevant product market for anti-trust purposes by no means includes all substitutes. In

[37] *United States* v. *E. I. duPont de Nemours & Co.* (Cellophane), 351 U.S. 377, 393 (1956). See also *Kansas City Star Company* v. *United States*, 240 F. 2d 643 (8 Cir. 1957), *cert. den.* 354 U.S. 923 (1957).

[38] Illustrations of inter-industry competition given in Lilienthal Big Business: A New Era (1952), c. 5, referred to by Mr. Justice Reed, include copper and aluminum; coal and oil; cotton, wool and synthetic fibres; trucks, automobiles, buses and airplanes; iron, copper and plastic pipe; glass, concrete, brick and asbestos building and insulation materials; and *even glass, cans, and plastic bottles.*

this connection the Court said in the *Times-Picayune* case: [39]

> For every product, substitutes exist. But a relevant market cannot meaningfully encompass that infinite range. The circle must be drawn narrowly to exclude any other product to which, within reasonable variations in price, only a limited number of buyers will turn; in technical terms, products whose "cross-elasticities of demand" are small.

This appears to be what the Court had in mind in *Brown Shoe* when it said: [40]

> The outer boundaries of a product market are determined by the *reasonable* interchangeability of use or the cross-elasticity of demand between the product itself and substitutes for it. (Emphasis added.)

In this case the circle referred to in *Times-Picayune* cannot be drawn to include within the boundaries of a single product market the metal can, glass container and plastic container industries and their wide variety of products. Attempts by the Government here to combine these separate industries and their products or to combine separate and distinct products from separate and distinct industries into single product markets necessarily failed because appropriate distinctions were not made between inter-industry or overall commodity competition and the type of competition between products with reasonable interchangeability of use and cross-elasticity of demand which has Clayton Act significance.

The boundaries of a product market or sub-market may only be determined "by examining such practical indicia as industry or public recognition of the [mar-

[39] *Times-Picayune Publishing Co.* v. *United States*, 345 U.S. 594 (1953) at p. 612, fn. 31.

[40] *Brown Shoe Co.* v. *United States*, *supra*, p. 325.

ket] as a separate economic entity, the product's peculiar characteristics and uses, unique production facilities, distinct customers, distinct prices, sensitivity to price changes, and specialized vendors."[41]

Nevertheless, the Government here has made an attempt to establish a product market embracing all of these separate industries and products and many more in the line of commerce which it denominated as the packaging industry. The theory upon which it proceeded on this line of commerce is illustrative of its failure to make the distinctions I have pointed out.[42]

Moreover, with the exception of the lines of commerce denominated as the metal can industry and the glass container industry, each of which were conceded to be separate product markets and the line denominated "containers for the beer industry" which I have found to be a separate product market, the Government also ignored these concepts in attempting to combine products produced by separate industries, which were not shown to have reasonable interchangeability of use or cross-elasticity of demand, into relevant lines of commerce. Examination of such practical indicia for determining product markets as were in the record did not establish that there were such lines of commerce. These lines of commerce were artificially carved out by the Government and did not conform to the realities of the marketplace.

We therefore do not have here the pattern of a horizontal combination between two companies which manufacture or sell the same products, as the Government seemed to assume. Nor are we concerned with the pattern of a vertical combination. Neither

[41] *Brown Shoe Co.* v. *United States*, *supra*, p. 325.

[42] See discussion of "The packaging industry," pp. 50a–52a, *infra*.

Continental nor Hazel-Atlas was engaged in any essential step in the processing, manufacture or sale of products made or used by the other.[43]

What we have here, basically, is a conglomerate combination in which one company in two separate industries combined with another in a third industry for the purpose of establishing a diversified line of products suitable for a variety of end uses to be sold to a wide range of customers with differing packing requirements.

> Such a merger * * * does not have the effect of automatically foreclosing to competitors any market outlet or source of supply as in a vertical merger, nor does it have the effect of automatically eliminating a competitor as in a horizontal merger.[44]

Here the Government moved into virtually uncharted Section 7 territory. In the twelve years since Section 7 was amended there are apparently only two other cases raising this exceptional problem. They are *United States* v. *General Motors* (Euclid Road Machinery) which is currently pending in the District Court for the Northern District of Ohio, and the *Proctor & Gamble* case before the Federal Trade Commission which has just been cited. A third case, *United States* v. *General Dynamics*, filed in this district on November 8, 1962 and as yet undetermined, may also involve the same problem to some extent.

To complete the background I should add that I have been unable to find any case dealing with a pattern of inter-industry and inter-commodity competition comparable to that which exists here nor in which

---

[43] But see discussion of corrugated shipping cartons, *infra*, pp. 60a–61a and containers for the beer industry, *infra*, pp. 65a–70a.

[44] *Proctor & Gamble Co.*, 3 C.C.H. 1961 Trade Reg. Reports ¶15, 24 F.T.C. Orders), at p. 20,257.

the diversification of products, industries and consumers is so pervasive.

This is not to suggest that enforcement of Section 7 may not be extended beyond the range of any of the cases thus far decided. For, as both *Brown Shoe* and the legislative history which it reviews make clear, Section 7 is applicable to conglomerate mergers where the facts warrant.[45] But there must be evidence that the facts warrant such application.[46]

Understandably the case of a conglomerate merger set in such a complicated inter-industry pattern as this presented great difficulties of proof for the Government. But that does not mean that the Government's burden was lessened or that it was relieved from the obligation of establishing relevant product markets or of showing reasonable probability of substantial anti-competitive effects in one or more of them as a result of the acquisition. In fact, in the case of a conglomerate merger such as this, where such a wide diversity of factors bear on questions of relevant markets and anti-competitive effects within them, the Government must be at pains to examine in detail all practical indicia which might bear on both questions.[46]

---

[45] *Brown Shoe Co.* v. *United States*, *supra*, p. 317.

[46] The comments of the Federal Trade Commission with respect to the standards of proof required in such a situation are not inappropriate.

"• • • the same tests apply as in any other matter coming within the purview of Section 7, but since a conglomerate acquisition does not have the above-mentioned 'automatic' effects of a vertical or horizontal merger, such a determination is necessarily difficult to make from a consideration of evidence relating solely to the competitive situation existing in the relevant market prior to the acquisition and to the pre-merger status of the acquired and acquiring corporations. Consequently, a consideration of post-acquisition factors is appropriate [as well]." *Proctor & Gamble Co.*, *supra*, p. 20,258.

In the case at bar the Government not only failed to do this but the evidence concerning such indicia as were examined was woefully inadequate. Even assuming that the theory upon which the Government sought to construct its line of commerce for the packaging industry, for example, were tenable, it conspicuously failed to adduce any evidence whatsoever to support its theory, as I shall point out in detail later. In the lines of commerce denominated containers for the soft drink, canning, toiletry and cosmetic, medicine and health, and household and chemical industries, moreover, its proof was also altogether deficient as to practical indicia showing that such product markets as these in fact exist. It failed to establish that these were relevant lines of commerce.

The Government's failure of proof was not confined to its attempted delineation of end use and other lines of commerce. Its failure was equally evident with respect to anti-competitive effects in the can industry, the glass industry and the beer container lines of commerce which it was successful in establishing.

Plainly, in order to make out a case under the Act the Government was required to show either that the acquisition had actually resulted in a significant diminution of the vigor of competition or that there was reasonable probability that it would do so. Unless it showed that there were actual anti-competitive effects of a substantial nature, which it did not, the reasonable probability test had to be met. As I have mentioned, there is no evidence of actual anti-competitive effects in this record, substantial or otherwise and the Government did not proceed on that theory.

Thus, the Government had to establish the reasonable probability of substantial anti-competitive effects from this acquisition and it had to do so under the facts and circumstances of this case and within the

framework and context of the industries and markets specifically involved.

The Government was not able to sustain this burden. Its case was based on what it claimed to be anti-competitive effects which *might* occur in the future. No doubt if the evidence here had shown that there was a reasonable probability that future effects of a substantial nature would occur, sufficient would have been shown to make out this element of the case.[47] But no such showing was made. It is a far cry from *might* occur to a reasonable *probability* of occurring.

Reasonable probability of the lessening of competition in the future is just as much subject to evidentiary proof as is actual lessening of competition. Mere speculation or conjecture cannot be substituted for proof of reasonable probability. Nor are mere possibilities that competition might be lessened in the future, or inferences to that effect, sufficient.

In the absence of evidence of reasonable probability of anti-competitive effects the Government has speculated as to what might occur and has substituted what are at best mere possibilities for reasonable probabilities.

For example, the Government laid great stress throughout on prior acquisitions by Continental and urged that the overall history of such acquisitions impels the conclusion that the Hazel-Atlas acquisition was repugnant to the statute.

It is plain that the Act requires intervention in a cumulative process of acquisitions where the effect may be a significant reduction in the vigor of competition in any line of commerce.[48] But this cannot be

---

[47] *Brown Shoe Co.* v. *United States*, *supra*.

[48] *Brown Shoe Co.* v. *United States*, *supra*, pp. 318, fn. 32, 333–334, 345, fn. 72.

assumed. It can only be established by showing that such effects had in fact occurred or that it was reasonably probable that they would. There is no such proof in this record.

The evidence as to prior acquisitions here is confined to two documents which were answers by Continental in 1946 and in 1956 to inquiries made by the Government and passing references in a letter in which Continental outlined to the Anti-Trust Division its position with respect to the proposed acquisition of Hazel-Atlas.[9] All that these documents show is that Continental has, over a period of many years, acquired a substantial number of companies, or portions of companies, in a wide variety of businesses.

Many of the acquisitions were made a number of years ago in the 1920's and the 1930's. Many were extremely small. Some were the result of liquidation sales. Some appear to have been cleared with the Department of Justice or to have had its tacit approval. Some were located in Canada. Some of the companies acquired were subsequently sold.

None of the companies acquired in the ten years prior to suit were can companies. No glass company had ever been acquired before. As I will point out a little later, the objectives of the acquisitions carried out over the last ten years at least, and of a number before that, were to diversify Continental's product lines.

The Government did not show what the effects of any of these acquisitions were, cumulative or otherwise. There was no evidence that they had any anti-competitive effects in any of the industries or product markets to which they were related. The Government's conclusion that anti-competitive effects will necessarily flow from this merger because of Con-

[9] G-785, G-786, G-900.

tinental's prior acquisitions is pure conjecture, unsupported by evidence.

Indeed, such evidence as there is tends to negative such a conclusion. Continental's letter to the Anti-Trust Division, outlining its position with respect to the proposed acquisition,[50] states its purposes and intentions in making the acquisition.

Plainly, purpose and intention are not in any way controlling in a Section 7 case. But purpose and intention are factors which may be taken into account together with all the other factors in the case in predicting the probable future conduct of the parties and the probable effect of the merger.[51] Viewed in that context purpose and intention may throw some light on the effects which might reasonably be anticipated from the merger.

The Government placed heavy reliance on Continental's letter stating the purpose of the acquisition. As expressed in that letter the purpose was a further diversification of Continental's various lines of products to include for the first time a glass container division.

The history of prior acquisitions by Continental indicates its design to diversify increasingly so as to be able to maintain independent lines of various kinds of materials used by packers of many kinds of products and to service a wider variety and number of customers. As a result of this program, apart from metal cans, other products which it had come to produce included fibre drums, kraft liner board, flexible packaging materials, plastic containers, crown caps, vacuum type metal closures, various types of can and closure machinery, paper cups and plates, and steel pails. By the acquisition of Hazel-Atlas, Continental

[50] G-900.

[51] *Brown Shoe Co.* v. *United States*, *supra*, p. 329, fn. 48.

further diversified its product lines to include glass containers and other glass products, screw and lug type metal closures and home canning closures.

There was no evidence that Continental's program of diversification resulted in the suppression of new lines which it acquired. Nor was there evidence that competition in these lines was curtailed or that any pressures, either directly or indirectly, were brought in any of them which tended to create any anti-competitive effects. Though the case was tried almost four years after the acquisition, far from indicating that there had been any such post-acquisition effects, the evidence was to the contrary. This is especially significant in the case of a conglomerate merger such as this.[52]

The announced, and, indeed, actual policy which Continental followed was to encourage development of the new lines in separate corporate divisions and to promote intra-company competition so as to strengthen its overall ability to compete with other companies in the different industries and different product lines in which it was doing business.

There are no indications in the record that the acquisition tended either to weaken the position of Hazel-Atlas as a competitive factor in the glass industry or in any of its product lines, or to weaken Continental's position as a competitive factor in the metal can industry or in its product lines. Nor is there anything to show that such positions were so strengthened as to have any significant anti-competitive effects in any of the industries or markets involved here.

In the light of the situation in the metal can and glass container industries, the apprehension expressed by the Government that Continental was likely to

[52] *Procter & Gamble Co., supra*, p. 20, 258.

eliminate or limit the manufacture of glass containers after the Hazel-Atlas acquisition or to eliminate or limit some of its can lines, is not only unsupported by the evidence but also unfounded. In fact any such course would have run counter to Continental's concept of the theory and purpose of its diversification program.

The Government views with alarm every advantage which Continental or Hazel-Atlas might gain as a result of the merger and sees in each the spectre of anti-competitive effects. But the mere fact that the competitive position of acquiring or acquired companies may be improved by a merger does not establish that the merger is harmful or has any of the proscribed anti-competitive effects.[33]

The test is not whether, as a result of a merger, either the acquired or acquiring company obtains advantages which help it to compete more effectively. Obviously were this so, any merger permitted under the Act could have no sound business justification. The object of the Clayton Act is not to discourage businesses from taking steps to compete more effectively but to keep competition vigorous and effective. Opportunities to offer improved products, to make cost reductions or to give better service to customers are not in themselves indications of anti-competitive effects. These are all legitimate business objectives. "It may well be that by effecting a better arrangement for a more profitable undertaking * * * competition would be stimulated rather than lessened."[34]

Thus, the Government could not have succeeded here merely by showing that there were competitive advantages accruing to the acquiring or acquired

---

[33] *Brown Shoe Co.* v. *United States*, *supra*, pp. 319–320. See also Address by Attorney General Robert F. Kennedy, Economic Club of New York, Nov. 13, 1961.

[34] 96 Cong. Rec. 16,456 (1950). (Remarks of Senator O'Conor.)

companies or both from the merger. It is the *anti-*competitive effects of the merger with which the statute is concerned—that is to say, the lessening of the vigor of competition, rather than the converse. Competitive advantages are not proscribed unless there is a reasonable probability that anti-competitive effects of some significance in the relevant product markets will result. No such showing was made.

The Government also contended that "concentration" in the industries and product markets involved resulted from the merger which should be considered as a key factor in establishing that there was reasonable probability of anti-competitive effects or tendency to monopoly.

Concededly Continental was a very large corporate entity. So to a much lesser degree was Hazel-Atlas. They stood second and third respectively in their industries and each had substantial shares in different product markets.

It is not to be doubted that size and market shares are factors to be taken into account in determining anti-competitive effects and tendency to monopolize. But mere size or concentration alone are not decisive. As the Supreme Court has said, exclusively mathematical tests are to be avoided.[33]

Such tests are particularly inapposite where a conglomerate merger is under scrutiny. In such a situation the Supreme Court's stricture that the merger must be "functionally viewed, in the context of its particular industry"[34] becomes especially meaningful.

A conglomerate merger does not result in the elimination of a competitor but merely substitutes the

---

[33] *Brown Shoe Co.* v. *United States*, *supra*, p. 321, fn. 36. See also *A. G. Spalding & Bros., Inc.* v. *Federal Trade Commission*, *supra*, pp. 625–626; *Crown Zellerbach Corporation* v. *Federal Trade Commission*, *supra*, p. 826.

[34] *Brown Shoe Co.* v. *United States*, *supra*, pp. 321–322.

competition of the acquiring company for that of the acquired company in the lines of commerce in which the acquired company was formerly engaged. Thus such a merger does not in itself result in any increase in industry or product market concentration and the shares of the acquiring and acquired companies in their respective product markets are the same as they were before.

Of course, if the product markets served by the acquiring and acquired companies are closely tied together, it is possible that substantial competitive advantages may accrue which could result in changes of market positions. It was not shown that this was the situation here, however, and though, at the time of trial three and a half years had elapsed since the merger, there was no indication either that any such changes had occurred or were reasonably likely to occur.

The record here is replete with statistics. Basic figures have been combined, separated, recombined and then combined again. Many of these combinations have no sound statistical basis and are predicated on implausible hypotheses not supported by evidence. Figures have been placed in unnatural and illogical groupings without regard to dissimilarity of products, separate and distinct industrial patterns or the realities of the marketplace. This was particularly evident in the proof concerning the last five lines of commerce where the Government unsuccessfully attempted to combine different products produced by different industries solely in terms of end uses.[37]

[37] These lines of commerce are containers for the soft drink industry, pp. 70a–76a, *infra*, the canning industry, pp. 76a–83a, *infra*, and the toiletries and cosmetic industry, the medicine and health industry, and the household and chemical industry, pp. 83a–91a, *infra*.

The 78 witnesses placed on the stand by the Government included, in addition to one can manufacturer, 18 representatives of glass container manufacturers, several plastic container manufacturers, three minor food packers, and a number of firms manufacturing toiletries, cosmetics and drugs.

Yet the Government failed to adduce testimony from these witnesses from which inferences or conclusions could be reasonably drawn that there was reasonable probability of anti-competitive effects or monopolistic tendencies. These witnesses, instead, gave a picture of keen and vigorous competition within the industries and markets with which they were respectively familiar and between such industries and markets and the other industries and markets involved, both before and after the acquisition. None of them gave evidence tending to show either that the merger had in fact lessened competition in any line of commerce or that there was any reasonable probability of its doing so.

Viewing the evidence as a whole, quite apart from theory, there was a total failure by the Government to establish the essential elements of a violation of Section 7. As will be apparent from a discussion of the proof relating to each specific line of commerce, the Government did not lay either the statistical or testimonial foundations required to establish its case. It was this failure of proof which required the dismissal of the complaint and entry of judgment for the defendants.

VI

THE PROOF AS TO THE LINES OF COMMERCE SPECIFIED BY THE GOVERNMENT.[58]

(1) "The packaging industry"

The claim of the Government as to this line of commerce was dismissed during the oral argument of defendants' motion made at the close of the Government's case.

The evidence in the record on which the Government relied to establish what it called "the packaging industry" product market was confined to the mid-1956 letter from Continental answering Department of Justice inquiries concerning its proposed acquisition of Hazel-Atlas.[59] In that letter Continental outlined its diversification program and stated it was attempting to provide "tailor-made packaging" for a wide variety of products. In discussing this program the letter used the generic but undefined term "the packaging industry."

As requested, the letter estimated the percentage of the national market held by Continental in various groups of products for the year 1955. The products listed included metal cans, steel pails, lithographed kitchenware made of tin plate, unspecified military items, can closing equipment, metal closures, cork products, low pressure laminates, injection molding, rigid plastic containers, squeeze bottles, plastic pipe and fittings, paperboard, paper products (including paper cups and plates, nested containers and fibre drums) and flexible packaging.

The estimates made by Continental of its share of the markets in these various products ranged from

---

[58] The lines of commerce will be discussed in the order in which they are listed at page 31a, *supra*.

[59] G-900. See *supra*, p. 44a.

less than 2% in such product categories as paper board and injection moldings, to 31.4% in metal cans, and in the single instance of fibre drums, to approximately 80%. With respect to several products no figures were available from which any informed estimates could be made and some of the products listed, such as plastic pipe, were no longer produced by Continental.

In addition to these product categories the Government apparently also sought to include within this line of commerce corrugated shipping cartons and other products manufactured by Gair, and glass containers, glassware, screw type metal closures and closures for home canning jars produced by Hazel-Atlas.

There was no definition of the boundaries of this alleged line of commerce in the record. Nor were there any universe figures for it. The Government offered in evidence a table purporting to compare the value of all packaging materials sold in 1957 and 1958 with the net sales and operating revenues of Continental for these years.[*] The table was excluded because there was no substantiation whatsoever of the overall figures which it contained. The comparisons which the table attempted to make between Continental's sales and revenues and the value of all packaging materials sold were shown to be utterly unsound statistically and entirely unsupportable. During the colloquy concerning the admission of this exhibit, it became apparent that the Government conceived of "the packaging industry" as involving a sales volume of more than ten billion dollars. The products which it sought to include fell into 43 general categories, each of which was sub-dividable into countless individual items. The product ranged from

[*] G-803(5c) for id.

cooperage to grocery boxes, from transparent film to steel drums, from pill boxes to plastic and glass carboys, from fruit and vegetable baskets to plastic tubes and from Christmas wrappings to cigar boxes. Here we are veritably wandering in a sort of Clayton Act Wonderland where there is talk "of shoes—and ships—and sealing wax—of cabbages—and kings * * *"[41]

It is manifest that the broadest application of the product market test of "reasonable interchangeability of use or cross-elasticity of demand" could not possibly encompass this wide diversity of products and there was no evidence that it did. Nor was there any evidence concerning industry or public recognition of the market, peculiar characteristics and uses of the products involved, unique production facilities, distinct customers, distinct prices, sensitivity to price changes, specialized vendors, or any of the other practical indicia by which a product market may be determined.[42]

Moreover, the record does not even show the names of the companies which were claimed to be a part of the industry, to say nothing of where they were located, what their annual sales were, or anything about them. There is nothing at all in this record from which it could be found that a relevant "packaging industry" product market exists.

Furthermore, there was no evidence at all about competition within this alleged market, let alone anti-competitive effects. In sum, there was complete failure of proof.

---

[41] Lewis Carroll (Charles Lutwidge Dodgson), *Through the Looking-Glass and What Alice Found There*, Chap. IV, Stanza 11.

[42] See discussion *supra*, pp. 8a–9a.

(2) "The metal can industry."

The defendants conceded that this line of commerce, as delineated by the Government, was a separate and relevant product market, and I have so found. Thus, the Government's burden was confined to establishing that, in this product market, there was reasonable probability of substantial anti-competitive effects resulting from the acquisition.

The Government claims that in this line of commerce, as a result of the acquisition:

(a) Continental's increase in size and diversity, and its consequent ability to offer a full line of container products, gave it an advantage over smaller and less diversified can manufacturers which threatened to be decisive.

(b) Entry into the industry was made more difficult and more unlikely than prior to the merger, and the possibility of new entry was significantly decreased.

(c) It was probable that similar mergers would be triggered and that such further acquisitions would make effective competition less likely.

(d) Continental's incentive to push metal cans as against glass or plastic containers was reduced, and it was therefore less likely to be an industry innovator and pioneer.

(e) And finally, there was a tendency toward monopoly because the merger tended "to aggravate a general oligopolistic trend" in the industry.

We are dealing here with the effects of the merger in a specific line of commerce—the metal can industry. Unless the probability of substantial anti-competitive effects were shown in that industry, the Government case as to this line of commerce necessarily failed.

696-226—63—6

The Government's difficulty here was the same that it encountered so frequently in this trial. Its claims are pure speculation and, as far as I can discern, are not supported by any proof that it was reasonably probable that the claimed results would follow.

a. The Government urged that Continental obtained an advantage over its competitors in this industry which threatened to become decisive because of its ability after the merger to offer a "full line" of metal, glass and plastic containers, closures of various types and closure machinery. But there was no testimony that a can manufacturer obtained any particular competitive advantage by offering a full line of container products.

The only can manufacturer who testified was the Chairman of the Board of National Can, the No. 3 company in the industry, which manufactured general line and packers' cans only. His testimony was to the effect that National was expanding its operations; that it had built a new plant as late as 1956; that competition in the industry was "tougher"; but that National's earnings figures had gone down somewhat since 1956 though to what extent was not shown. He did not testify that there was any competitive advantage to be obtained in the can industry from offering a full line of products. Nor did he indicate that whatever decline in earnings National had had since 1956 was in any way ascribable to the Hazel-Atlas-Continental merger.

No other can manufacturer was called to testify. No one else testified on this subject. There were no documents or figures in the record supporting the Government's contention.

Plainly Continental, by its diversification program, expected to be able to compete more effectively against the strong competition in this highly competitive

market.[42] But on this record it would be sheer speculation to conclude that because this was so, anti-competitive effects were likely to occur, to say nothing of competitive advantages which threatened to become decisive. There was no evidence of any such probabilities.

b. Much the same can be said of the Government's contention that the acquisition made new entry into the industry more difficult and significantly reduced the possibility of such entry. The only evidence which might be considered to bear any relation to this contention is the testimony of the National Can Board Chairman that there had been no new company among the six top producers since 1935, and that of the Board Chairman of Owens-Illinois Glass concerning the metal can business which that company carried on between 1936 and 1944.

The National Can Chairman did not testify that there was undue difficulty in entering the metal can industry at any time. This can scarcely be inferred from the fact that competition in the industry was keen and vigorous and becoming increasingly so. It is of course always difficult to enter a highly competitive industry. But the Clayton Act was surely not designed to make an industry less competitive so as to encourage new entrants. It was designed to insure that competition remained keen and vigorous.

As to the Owens-Illinois experience, it appeared that this company acquired various metal can companies in 1936, made a profit from its can business immediately before the war and disposed of the business in 1944 when, because of the war, it was difficult to get the necessary supply of tin plate. It then sold its can business to Continental for $7,500,000. Continental did not acquire any other metal can

[42] See discussion *supra*, p. 45a.

company in the ensuing sixteen years up to the time of the trial.

There was no other evidence in the record bearing on this contention. There was no showing that the amount of capital required to enter the industry was unreasonably large, that any unobtainable know-how was required, that there were any patent barriers to entry, or that any other factors made entry difficult for anyone desiring to go into the business. Indeed, there was no evidence at all concerning problems of entry at the time of the merger or subsequently.

Once again the Government's claim was based on sheer speculation unsupported by proof.

c. There was no showing that this acquisition would trigger further acquisitions of glass companies by can companies. To sustain this contention the Government seized on a passing mention by the Executive Director of the Glass Container Manufacturers Institute that he had heard a rumor to the effect that a relationship had recently been established between American Can and Wheaton Glass Company. The subject was dropped there and never referred to in the evidence again. The Government made no effort to call either American Can or Wheaton to find out anything about this. There was nothing to show the nature of the arrangement, the reasons for it, what it was all about, or indeed that it in fact existed. Nor was there anything to show that if it did exist it had any connection with or bore any relation to the Continental-Hazel-Atlas merger.

d. The Government fared no better on its claim that as a result of the merger Continental was likely to lose the incentive to push can sales at the expense of glass. The Government introduced no evidence showing either that there had been or was likely to be any slackening of effort to push can sales. On the con-

trary, as has been pointed out, the object of the merger was diversification, and Continental was actively promoting intra-company competition between its various product lines." Since by far the largest proportion of Continental's business was in metal cans, it scarcely seemed likely that cans would suffer at the expense of glass.

Moreover, subsequently to the merger Continental actively engaged in a vigorous research and promotion program in both its metal and glass container lines. In the light of the record and of the competitive realities, the notion that it was likely to cease being an innovator in either line is patently absurd.

e. Finally, the Government's claim that the acquisition would tend toward monopoly in the can industry rests on no firmer footing than the other claims just discussed. What the Government said it meant by this claim was that the merger would "tend to aggravate a general oligopolistic trend in an industry."

As far as I can discern, what the Government relied on in terms of specifics was that Continental had widely diversified its product lines by acquiring other companies engaged in different businesses and now has assets and sales in excess of one billion dollars.

The Government placed in the record figures purporting to show the share of Continental in the combined metal can and glass container industries based on alleged total unit production. At best these figures rest on a somewhat shaky statistical foundation. But even accepting them at face value, Continental's share of the combined industries in 1957 was less than 25% and it remained in second place behind American Can which does not produce glass containers. The competition in both industries has consistently been keen and vigorous. There are many strong compet-

[11] *Supra*, pp. 43a–46a.

ing companies in both industries and there was no evidence of any dimunition of competition. No reasonable probability that the merger will tend to create a monopoly was shown or could reasonably be inferred.

(3) "The glass container industry."

This line of commerce, as delineated by the Government, was also conceded by defendants to be a separate and distinct product market and I have found that it was. Here, too, the Government's only obligation was to establish reasonable probability of substantial anti-competitive effects in a recognized product market.

Its claims were in large measure the same as those it made with respect to the metal can industry. It contended that the increased size and diversity of Continental after the merger, and its ability to offer a full line of container products gave it a competitive advantage in the glass container industry that threatened to become decisive; that entry into the industry had been made more difficult by the merger; that the acquisition would trigger self-defensive similar acquisitions; that there was less incentive for Continental to push glass at the expense of cans or plastics; and that there was a tendency toward monopoly in the industry.

All of these contentions failed for lack of evidence to support them. Little needs to be added here to what has been already said under the metal can line. Only additional features specifically bearing on the glass container industry will be discussed.

The evidence on which the Government relied to establish the likelihood of increased difficulty of entry into the industry as a result of the acquisition is illustrative of how flimsy its proof was on much of

this case. The major emphasis was placed on a letter from Emhart Manufacturing Company, a producer of glass forming machinery, to the Anti-Trust Division in 1958.[46] The Government urged that a paragraph of the letter headed "Glass Container Business Requirements" stated the factors showing difficulty of entry into this field. A reading of the paragraph on which the Government relies is illuminating:

> It is Emhart's opinion based on its experience that an essential requirement in entering the glass business is to obtain the services of at least one good man of executive or managerial caliber, experienced in the art of manufacturing glassware. A great deal of know-how is required, but the glass technology and engineering services of Emhart and others specializing in this industry are available. Machine operators are usually obtained from the unions. A large amount of capital is required. A real problem exists in finding a market for new production in competition with established manufacturers.

It is difficult to understand the claim that this paragraph supports the Government's position. The paragraph certainly does not show that entry into the glass container industry is any more difficult than would normally be expected in a well established highly competitive industry. The only indication as to what the statement "a large amount of capital is required" means is a proposal which Emhart made to Gallo Wine Company in 1956 with reference to the establishment, from the ground up, of a plant to meet Gallo's substantial wine bottle requirements. Emhart estimated the cost as slightly more than three million dollars, surely not an unreasonably large capital requirement for the institution of such an enterprise.

[46] G–364.

The Government's reliance on the failure of the Neville Island Glass Company in 1947, to show difficulty of entry in 1956, is just as far removed from reality.

This small company never got off the ground and lasted less than a year before it went into a Chapter X reorganization and was thereafter liquidated. As appears from the Section 167 report of its Trustee in Reorganization,[46] the company was doomed from its inception due to egregious under-capitalization, inadequate facilities, and incompetent management. Its failure, occurring nine years before the merger and thirteen years before the trial, proves precisely nothing.

As against this evidence, or lack of it, it appears that five new companies using Emhart machinery, and six other new companies, have in fact entered the glass container field since 1950, some independent and some captive. In addition, new production facilities have been placed in operation throughout the industry at a rapid rate, the growth and expansion of the industry have been rapid, and competition has consistently been keen and vigorous.

The Government also urged that Hazel-Atlas obtained competitive advantages in the glass container industry which threatened to become decisive because the Gair Division of Continental manufactured corrugated shipping cartons in which glass containers are usually shipped. This is the one instance in this case where the Government contended that there was an aspect to the merger of a vertical nature since the shipping carton represents a not insignificant part of the cost of the glass container as shipped. But here again the proof failed to support the theory.

Owens-Illinois and Anchor-Hocking, among other major glass container companies, produced corrugated

[46] Defendants' Exh. J.

shipping containers for their own use. Other companies used local suppliers in the vicinity of their plants, generally more than one local supplier. Yet others, such as Ball Bros., both manufactured such containers themselves and bought locally.

Corrugated shipping containers are readily available in any quantities required. There was nothing in the record to show that Hazel-Atlas, which before the merger was third in the industry and did not manufacture cartons, or any other company which did not do so, was under the slightest competitive disadvantage against manufacturers who made their own. Nor was there any evidence that any significant competitive advantage was to be gained by producing cartons, much less a decisive advantage.

The Government's next contention was that significant competitive advantages in the glass container industry were likely to accrue to Continental as a result of the acquisition because it produced crown caps which were used to close glass beer and beverage bottles, vacuum type closures used to seal hermetically glass jars, and vacuum closure machinery. Once more the evidence failed to support the Government's theory.

There was nothing at all about any competitive advantages to be derived by a manufacturer who produced both glass bottles and crown caps. As I shall point out a little later, Hazel-Atlas did not manufacture beer or beverage bottles or any other narrow neck bottles on which crown caps are used, to any significant extent, nor was there any likelihood of its doing so.[67] On the other hand, Anchor-Hocking and Owens-Illinois were large manufacturers of beer and beverage bottles. They did not manufacture crown caps. Their consistent positions in the industry make it

[67] See pp. 67a–68a, 73a–75a, *infra*.

manifest that they suffer no disadvantage from that fact. Plainly the crown cap contention has no merit.

As to vacuum closures and vacuum closure machinery—of the eighteen representatives of glass manufacturers who testified, seventeen did not refer to the subject of such advantages at all. The only glass manufacturer who mentioned it, the Vice-President of Brockway, indicated that there might be a sales advantage in selling both vacuum closures and glass containers. He said, however, that there was no reason why his company could not manufacture vacuum closures if it wished but that it had never chosen to do so. Significantly enough, according to his testimony, the sales of Brockway had risen from twenty-three million dollars in 1954 to fifty-one million dollars in 1959. It can scarcely be said that Brockway was significantly disadvantaged.

Owens-Illinois and Anchor-Hocking also make vacuum closures and machines for applying them. There was no evidence that any competitive advantages over other glass container manufacturers accrued to them because they did so.

The theory was also somewhat tentatively advanced by the Government that the Hazel-Atlas Division of Continental would have a significant competitive advantage in the glass industry by having access to the confidential customer lists of Continental. The Government offered no proof whatsoever to sustain this theory and it was without support in the record.

In addition the Government advanced the converse of the proposition which it urged with respect to the metal can line—that as a result of the merger Continental was likely to lose the incentive to push glass container sales at the expense of cans. In view of what has been said concerning the purpose of Continental's diversification program and the course it

pursued after the merger, it is no more likely that Continental would slacken its efforts to promote glass than that it would slacken its efforts to promote cans. Indeed, if it had planned to do so there would have been little, if any, point to acquiring Hazel-Atlas, a major glass container producer.

Whether the Government's claims as to the effects of the acquisition in the glass container industry be considered separately or in combination, it showed no reasonable probability of substantial anti-competitive effects or tendency to monopoly in this industry as a result of the acquisition.

(4) "Metal closures."

There are several types of closures used to close or seal containers, as I have already mentioned. They are made of a variety of materials, including tin plate, aluminum, plastic and paper.

The Government excluded from its "metal closure" line of commerce closures made of aluminum, plastic and paper and there were no statistics with respect to such closures in the record. It also excluded crown caps and home canning closures, both made of metal (tin plate). Thus the line of commerce which the Government defined as "metal closures" included only two types of metal closures—vacuum types closures and screw and lug type closures. The former were produced by Continental in its recently acquired White Cap Division but not by Hazel-Atlas, and the latter were made by Hazel-Atlas but not by Continental.

The proof offered by the Government failed to establish that vacuum type closures and screw and lug type closures can properly be combined into a single product market. In fact the evidence was to the contrary.

There was no public or industry recognition that such a product market existed. There was no showing of inter-changeability of use, cross-elasticity of demand or cross-sensitivity of prices between the two distinct types of product which the Government sought to bracket together. There were no distinct classes of customers or any specialized vendors for both products. Production facilities for the two were quite different.

These products do not have the same characteristics or end uses. Vacuum closures whether of the side-seal, top-seal or roll-on variety, are used almost exclusively for heat sterilized food products packed in glass containers where a vacuum is required to prevent spoilage. Screw type closures of metal and plastic, on the other hand, are used both for foods and non-foods. There was no showing that screw type closures were used on foods which require vacuum packing, and, as far as appears here, they are generally used to pack different food products from those which require vacuum closures and for non-food products as well.

Vacuum closures are applied by machine. A number of companies which produced vacuum closures, including Continental (White Cap), Owens-Illinois and Anchor-Hocking, also produced and sold or leased machinery for applying them. The closure machinery made by one company can be used to apply vacuum closures made by other companies, in some cases with and in some cases without minor modifications.

However, machines which apply vacuum closures cannot be used to apply screw type closures. They operate differently and much more speedily than screw type closure machines.

These two types of closures do not compete with one another to any significant degree, if at all. Each

is in a quite distinct and separate line of commerce and I so find. Indeed, it appears that the Government has abandoned its contention that this combination of products constitutes a separate line of commerce by failing to request a finding to that effect.

In view of the failure to establish this as a line of commerce it is unnecessary to discuss anti-competitive effects of the acquisition within it, though, in any event, proof of such effects was wholly lacking.

(5) "Containers for the beer industry."

This is the first of the lines of commerce which the Government sought to define in terms of end use. It is composed of metal cans and glass bottles sold to brewers and used to package beer.

The proof indicates the following:

Beer can only be packaged in metal cans or glass bottles. The cans and bottles used to package beer are suitable only for that purpose.

Beer generates specific pressures which are peculiar to it. Beer cans and bottles are therefore structurally designed to resist such pressures and are not suitable for liquids such as carbonated beverages which generate different pressures. Beer cans and bottles are made in the same sizes in terms of capacity. Cans used for beer have special linings. Because of the characteristics of glass, beer bottles need not be lined. Thus, beer cans and beer bottles not only have the same end uses but have some common characteristics.

Brewers constitute a distinct and limited class of customer for both and they are sold to no other customers. Either one or the other may be used by the brewer as he chooses.

The trade associations of both the metal can and glass container industries have made extensive studies of the competition between beer cans and beer bottles

and the inroads which they have respectively made on one another. Individual manufacturers, including Continental, have made similar studies. Each industry and the individual manufacturers in each were actively engaged in promoting the sale of one container as against the other.

Individual manufacturers of beer containers in each industry are sensitive to competition from the other. There was recognition in each industry of virtual interchangeability of use and cross-elasticity of demand between the two types of containers used for this purpose.

Manufacturers of beer cans and beer bottles showed considerable interest in the prices charged for the competing container and it is a fair inference that there was some price relationship between the two.

Of course, in view of the fact that defendants' motion to dismiss was granted at the close of the Government's case only one side of the picture was presented. At that stage of the case, however, the proof adduced by the Government, standing as it did uncontradicted, established prima facie that this was a relevant product market.

The basis on which the defendants' motion to dismiss as to this line of commerce was granted was not therefore the Government's failure to establish the relevant product market but rather its failure to establish the reasonable probability of substantial lessening of competition or tendency to monopoly in the market as a result of the Hazel-Atlas acquisition.

The statistics on which the Government relied to show the scope and extent of this product market were based on unit sales of cans and bottles.[*] These figures are of questionable accuracy with respect to beer can units because of the method of computation

[*] G-801 (1d), (2d), (3d).

used,[*] and with respect to beer bottle units because no weight was given to the fact that most beer bottles are returnable and are refilled an average of twenty-two times by the brewer.

Nevertheless, the figures in the record were an indication of the overall size of the market. According to these figures shipments of beer cans and bottles exceeded 8.8 billion units in 1955, 9.3 billion in 1956, and 9.6 billion in 1957. This was plainly a large product market.

Although at one time almost all packaged beer was sold in bottles, in a relatively short period the beer can made great headway and may well have become the dominant beer container. Beer cans represented approximately 83 percent of the total in 1955 and approximately 83.7 percent in 1957, though, as has been noted, the failure to give weight to the returnable bottle factor distorts these figures.

Continental's share of the beer can market, measured by units shipped, ran from 43 percent in 1955 to 46 percent in 1957. Its share of both beer can and beer bottle shipments, disregarding the returnable bottle factor, ran from 36 percent in 1955 to 38 percent in 1957. It is apparent that Continental had a sizeable share of the total product market.

The participation of Hazel-Atlas in the product market is in sharp contrast. Before the merger in 1955 Hazel-Atlas shipped only 8/10ths of one percent of the total beer bottles shipped, disregarding the re-

[*] The unit figures are arrived at by converting base boxes of tin plate to short tons of steel and then applying a conversion figure to the tonnage to arrive at a unit figure. The conversion figure is based upon a hypothetical number of beer cans which might have been produced from each short ton of steel consumed. Although the formula used is related to methods used by the Bureau of Census, the reliability of the outcome was not demonstrated.

turnable bottle factor. It shipped only 2/10ths of one percent of returnable beer bottles. In 1957, over a year after the merger, its total beer bottle shipments, again disregarding the returnable bottle factor, had barely advanced to 1.1 percent of the total beer bottles shipped.[79] There were no figures as to its shipments of returnable bottles in 1957.

These figures show only the extent of the Hazel-Atlas participation in beer bottles and not in the market composed of beer cans and beer bottles together. Its share in this overall market was only 14/100ths of one percent in 1955 and 17/100ths of one percent in 1957. The Hazel-Atlas share of the beer container product market was completely insignificant and indeed practically non-existent.

At the time of the merger for all practical purposes Hazel-Atlas was not a competitive factor in this product market, nor had it ever been. The acquisition of Hazel-Atlas by Continental could not have lessened existing competition in the market to any remotely significant degree and there is no evidence that it did. Nor was Continental's position in the market strengthened to any significant degree by the acquisition. It remained in second place behind American Can and its role in the market was not appreciably affected.

The Government did not stress the claim that there was any actual lessening of existing competition in this line of commerce as a result of the merger. It contended, instead, that there might be anti-competitive effects in the future because the potential of Hazel-Atlas as a competitor in the manufacture of beer bottles had been eliminated. The difficulty with this position was that the evidence failed to show that, had the acquisition not taken place, there was

[79] G-801(ld), G-800I.

any reasonable probability that Hazel-Atlas would become a significant competitive factor in the manufacture of beer bottles.

At the time of the acquisition Hazel-Atlas was primarily a manufacturer of wide mouth containers which could not be used for beer and had relatively few machines for the manufacture of narrow neck bottles. It did not make amber glass, required for most beer bottles, in any quantity. It was not able to produce beer bottles economically. Though it filled an occasional order it did not consider itself to be a manufacturer of beer bottles.

There was evidence that some of its wide mouth manufacturing machinery could have been converted to narrow neck manufacture at relatively little expense and that it would have been able to convert its flint glass tanks to [redacted] manufacture of amber glass had it desired to do [redacted] But the record is devoid of evidence that it had any intention of so doing, or any reason for such a step which could have been taken only at the expense of its regular product lines.

Hazel-Atlas had no surplus capacity and its production was fully occupied with supplying its customers in the glass lines in which it had significant sales. Its plans to build a new plant in Plainfield, Illinois, had been deferred due to heavy increase in the costs involved. There was no intention, in any event, of using the proposed plant for the manufacture of beer bottles or of converting any of its existing facilities to such use. The Plainfield plant was planned for the purpose of producing the regular Hazel-Atlas product lines in the general Chicago area so as to bring it closer to that market and reduce freight costs.

Such scraps of evidence as there are concerning Hazel-Atlas miniscule manufacture of beer bottles do not indicate that there was any likelihood of its be-

coming a significant competitor in the beer bottle field. There was a rumor that Hazel-Atlas was selling a few beer bottles on the West Coast in 1956 but there were also indications to the contrary. Two Hazel-Atlas salesmen in 1953, when it manufactured no beer bottles at all, referred to Owens-Illinois beer bottle prices in two unsolicited letters to the company. A Hazel-Atlas officer, in a speech made in 1954, made brief reference to limited experiments in amber glass. That is all there was on this subject. It was plainly not enough.

Of course, there was always the *possibility* that Hazel-Atlas might, at some undetermined time in the future, for some undetermined reason, have undertaken to become a significant manufacturer of beer bottles. That, however, was mere speculation and by no means met the reasonable probability test.

There was no evidence in the record of any reasonable probability that the effect of the acquisition would be substantially to lessen competition or to tend toward monopoly in the beer container market.

(6) "Containers for the soft drink industry."

The Government attempted to define this line of commerce, in terms of end use, as comprising metal cans and glass bottles used to package "soft drinks." However, it is difficult to understand just what the Government intended the term "soft drinks" to mean.

The statistics produced to support this line of commerce are confusing. The table as to shipments of glass containers included in this line of commerce was headed "Beverage containers, returnable and non-returnable."[n] The table for metal can shipments in-

[n] G-801(1e).

cluded in the line was headed "Soft Drink Containers."[15]

"Beverages" apparently included bottled water, a variety of fruit juices and other unspecified drinks. One Government statistician, testifying on these tables, said that they included "mostly soft drinks" but that bottled water in carboys was also included. On the other hand, a food technician called by the Government testified that he considered soft drinks to be in the food category. Some fruit juice containers were classified as food containers, and orange drink in wide mouthed glass jars was classified under the heading "Dairy Products."[16]

The Government's statistics were taken from Census Bureau figures, which in turn were derived from figures supplied by the Glass Container Manufacturers Institute. The Institute classified "beverages" as applying "to all bottles for soft drinks and water, carbonated or non-carbonated * * *." But this does not aid materially in resolving the confusion.[17]

There appeared to be no definition in the record of the term "soft drinks" as used in the metal can table

---

[15] G-801(2e). These statistics are predicated on the same theoretical computations as were used for beer cans—that is to say, unit base boxes of steel converted into short tons of steel, converted in turn into can units.

[16] For example, G-1205 gives the following instructions for reporting to the Institute production of containers for dairy products:

> "This classification applies to all containers used by dairies. It includes milk and cream bottles, and it also includes cottage cheese jars, *orange and chocolate drinks when not in narrow neck beverage bottles.*". [Emphasis added.]

I assume that orange and chocolate drinks, when in narrow neck bottles are classified under beverages and, therefore, come under "soft drinks." But to confuse matters further, fruit juices, when in narrow neck bottles are included under containers for foods.

but I will assume, for purposes of this discussion, that it includes at least carbonated and non-carbonated beverages."

The figures for glass and metal containers were combined in a third table purporting to show total container shipments of "glass and metal soft drink and beverage containers."[13] This is the table on which the Government relied to establish this line of commerce.

Assuming the line includes both carbonated and non-carbonated beverages, and perhaps other products, there is no evidence to establish that this is a separate and distinct product market.

The boundaries of the market were undefined and there was no showing of interchangeability of use or cross-elasticity of demand between the various types of containers included. In fact, carbonated beverages generate even more pressure than beer, and bottles and cans used for those purposes must be specially designed to withstand such pressures. They have different physical characteristics from bottles and cans used for other soft drinks.

The practical indicia to be examined did not show that a product market consisting of carbonated and non-carbonated beverages and soft drinks exists and I have found that no such market was established.

However, after the case was concluded there were indications that the Government's position changed and that it then sought to have this line of commerce

[12] There is no evidence to indicate whether or not G-802, Table 2e, the Government's table on metal soft drink containers lumps metal containers for both carbonated and non-carbonated beverages together, but in order for these figures to be at all relevant on this line of commerce they must be consistent with those used for glass containers and with the term "soft drinks" as used by the Government.

[13] G-801(3e).

confined to carbonated beverages only. If this be so, the Government shifted its position with respect to this line at a very late date indeed. But assuming this change in position to be permissible, the Government is faced with the difficulty that no record was made to support its altered theory.

There were no universe or total unit figures and no breakdown figures in the record showing shipments of carbonated beverage containers, taken by themselves, as distinguished from soft drink and beverage containers generally. In the absence of such figures it is manifestly impossible to determine the extent of such a market or the shares of Continental, Hazel-Atlas and other manufacturers in it.

But quite apart from the failure of the Government to establish a carbonated beverage product market consisting of metal cans and glass bottles, it failed to show any anti-competitive effects of the merger in such a market, if it existed.

After considerable initial difficulty, metal can manufacturers developed a can strong enough to resist the pressures generated by carbonated beverages. These cans had advantages which distinguished them from glass bottles, including unbreakability, greater lightness in weight, lack of necessity for return, faster chilling and less storage space requirements. However, the cost as compared with the bottle, and particularly the returnable bottle, was and continued to be high. The metal can for carbonated beverages was conceived of as a luxury package to be sold at a premium price with a resulting increase in the overall sale of carbonated beverages rather than a decreased use of bottles by beverage manufacturers.

However, can manufacturers made strenuous efforts to promote the use of metal cans for carbonated beverages as against glass bottles. Despite these ef-

forts, taking into account the estimate that returnable beverage bottles are reused twenty-five times, not more than 1½ percent of all soft drinks sold were packaged in metal cans and the cans used for this purpose constituted less than 1 percent of overall can production.

Continental's share of this small market for metal soft drink containers ranged from 36 percent in 1955 to 26 percent in 1957.

Disregarding the important returnable bottle factor, the Hazel-Atlas percentage of total shipments of glass beverage containers was only 0.04 percent in 1955, 0.08 percent in 1956 and 0.6 percent in 1957.[78] It would, of course, be very much smaller were weight given to the returnable factor. In 1955 Hazel-Atlas shipped no returnable beverage bottles. The Hazel-Atlas share of total glass and metal soft drink and beverage containers shipped, once again disregarding the returnable bottle factor, was 0.03 percent in 1955, 0.07 percent in 1956 and 0.48 percent in 1957.

Thus, as in the case of beer containers, the Hazel-Atlas share of the product market consisting of metal and glass containers for soft drinks and beverages was so insignificant as to be for all practical purposes non-existent. Indeed, in 1955, prior to the acquisition it was only 3/100ths of one percent, even less than in the case of beer. Were any figures for carbonated drinks alone available in the record it cannot be assumed that Hazel-Atlas's percentage of this market would be any more significant.

Moreover, Continental's share in the total market was far from large, even with the returnable bottle factor disregarded. If that factor be disregarded, its

[78] The percentage figures for 1955–1956 shown as 0.1 percent for each year in G-801 are incorrect. I have used the correct figures.

share of the total shipments of glass and metal soft drink and beverage containers was 7.2% in 1955, less than 5.4% in 1956, and less than 5.2% in 1957." Taking the returnable factor into account, however, as previously indicated, Continental's share of the market was so small as to be insignificant in terms of the overall market which the Government delineated.

Thus Hazel-Atlas was not a significant factor either in the theoretical beverage and soft drink container market or in the theoretical carbonated drink container market, nor had it ever been. In view of the limited acceptance of cans for these end uses Continental was scarcely more of a factor. Hazel-Atlas did not compete in these markets and the acquisition did not lessen competition in either of them to any remotely significant degree.

The Government also contends, as it did with respect to beer, that Hazel-Atlas was a potential competitor in the manufacture of beverage bottles and that anti-competitive effects may arise because such potential competition was eliminated by the merger. However, it was not established that there was any reasonable probability that Hazel-Atlas would have become a significant factor in the manufacture of soft drink bottles had the acquisition not taken place.

While Hazel-Atlas had produced a few satisfactory beverage bottles prior to the merger, its experience in this field was extremely limited and it had made only minor and very tentative efforts to sell such a product. Its facilities for decorating beverage bottles were inadequate, it had no franchises from any of the large bottlers such as Coca Cola which required their bottle manufacturers to be franchised, and the Hazel-

[11] Continental's shares of the overall market for 1956 and 1957 shown on G-801(3e) include the bottles produced by Hazel-Atlas during those years.

Atlas management felt that small bottlers were not desirable customers since they were poor credit risks. With the exception of a brief passage in a speech by a Hazel-Atlas officer in 1954 which pointed out some of its difficulties in this area, there was nothing in the record indicating any likelihood that it would become a significant competitor in this field. The conclusion that it might have become so at some indeterminable time in the future is mere speculation.

The Government also urged that the acquisition reduced the incentive of Continental to press its metal can line for packaging soft drinks. There was not the slightest evidence to support this theory. Quite apart from the considerations regarding Continental's diversification program, already discussed, there was in fact no reduction in Continental's activities in promoting soft drink cans after the acquisition.

Thus I find that the Government failed to establish either a line of commerce consisting of "containers for the soft drink industry" or a line consisting of containers for carbonated beverages. Moreover, even had it done so there was no showing of any reasonable probability that the effect of the acquisition would be substantially to lessen competition or tend to monopoly in either of such product markets.

(7) "Containers for the canning industry."

The line of commerce which the Government denominated "containers for the canning industry" included all metal cans and glass containers for the end uses of "canning" food. "Canning" was specifically defined by the Government as "the process of sterilizing foods, including juices, by heat and hermetically sealing them in tin cans and glass containers."

The Government's case as to this line of commerce was predicated on its definition of "canning." Yet

the statistics concerning metal cans and glass containers which it placed in evidence to support this line[78] cannot be equated to its definition. These statistics related to glass and metal containers used for foods generally and were not limited to containers for foods which were heat sterilized and hermetically sealed. Though a number of foods are hermetically sealed when packed, many are not hermetically sealed and many others, though hermetically sealed, are not heat sterilized. Containers for all of these kinds of food were nevertheless included in the Government's figures.

The tables introduced did not show which of the containers included were used to pack either heat sterilized or hermetically sealed foods, or both, and which were not. Some of the products included, moreover, such as coffee, were not even considered to be foods.[79]

Thus there were no universe figures in the record as to the amount of containers used for canning food as this term was defined by the Government, or any showing as to Continental's share of the metal cans, Hazel-Atlas's share of the glass containers, or their combined share of the containers of both types shipped for such end uses.

"Containers for the canning industry" was one of the lines of commerce specified by the Government be-

---

[78] G-801(1c), (2c), (3c).

[79] Excluded from the Government's definition of canned foods by one or both of the food experts who testified for the Government, were such items as coffee, mayonnaise, vegetable oil, shortening, syrup, concentrated fruit juices, pasteurized whole milk, pasteurized barbecue sauce, maraschino cherries, green and Spanish olives, peanut butter, nuts, condiments, frozen fruits and vegetables. Some items such as vinegar, pickles, fruit preserves and fruit jellies were excluded by one expert and included by the other.

fore the pre-trial sessions began and its definition of this product market remained unchanged until after the case had been concluded. However, after defendants, upon argument of their motion to dismiss, had pointed out the deficiencies in the Government's proof as to this product market, the Government abandoned its claim that there was such a line of commerce. It then advanced for the first time the theory that the process of heat sterilization should not properly be included as a factor in defining this line and that only hermetic sealing was significant.

Thus, after all the evidence was in, the Government attempted to substitute an entirely different line of commerce for the one which it had theretofore consistently advanced. The new line was composed of glass containers and metal cans used to pack hermetically sealed foods and its boundaries were quite different from those of the line on which the case had been tried and on which the defense had been conducted.

However, the Government was in no better position to sustain this new line of commerce than it had been to sustain the old. It was apparent that the statistics in evidence combined both containers for foods which were hermetically sealed and those for foods which were not. For example, they included undetermined amounts of containers used to pack a large variety of products such as mayonnaise, mustard, honey, whole milk and baking powder, which were not hermetically sealed. Indeed the figures included metal cans and glass containers used to pack all types of food in the following categories: Fruits and vegetables (including juices); evaporated and condensed milk; other dairy products; meat (including poultry); fish and seafood; coffee; lard and shortening and all other food.

Thus the Government's statistics on its revised theory of this product market did not give any universe

figures for shipments of glass or metal containers, or both, used to pack hermetically sealed foods. Its figures were not and could not be broken down to show totals for foods hermetically healed and those not hermetically sealed. Nor was there anything in the record from which to ascertain the amounts of cans in either category produced by Continental or by other manufacturers in the metal can industry, or the amounts of glass containers in either category produced by Hazel-Atlas or others in the glass container industry.

Thus, the Government's position in substance boiled down to this—that on the basis of statistics covering containers used for packing all types of food, whether hermetically sealed or not, and with no showing as to the proportions of containers used for hermetic sealing it sought to have the court find a line of commerce consisting of metal cans and glass containers used to pack hermetically sealed foods only.

It is manifestly impossible on the basis of such figures to determine the boundaries of a product market consisting of metal and glass containers for hermetically sealed foods. Nor can it be ascertained, in terms of end uses, what products were packed in hermetically sealed containers and what products were not.

Moreover, there was no showing that there is any public or industry recognition of such a product market or sub-market. Nor did any of the other indicia for determining whether there was such a relevant product market show that such a market or submarket exists.

There remains only what appears to be some suggestion by the Government that there might be a product market consisting of metal cans and glass containers used to pack all of the types of food products included in the Government's statistics.

Such a line of commerce commends itself neither to logic nor to the realities of the market place. It not only includes a vast number of disparate products but it excludes a large number of similiar products. If milk bottles are included, as they apparently are, why are paper milk cartons excluded? If screw top glass jars for hard candies are included, why are not cellophane bags for such candy also included? If jars and cans for spices are included in the market, why not cardboard containers, with or without metal ends, for spices?

Again, as in the case of the claimed product market for hermetically sealed foods, there was no public or industry recognition of any such product market as was suggested. The metal cans and glass containers included within it do not have the same physical characteristics and uses. Their shapes, sizes and other characteristics differ widely, depending upon the type of food to be packed in them. The characteristics of metal cans and glass containers used for packaging food do not differentiate them from cans and glass containers used for other purposes. Metal or glass food containers were not sold differently or shipped differently from non-food containers.

There was no showing of reasonable interchangeability of use or cross-elasticity of demand as between metal and glass containers used for packing food. At least sixty categories of foods are packed either in cans entirely, or almost entirely, or in glass entirely, or almost entirely.[80]

The Government went to some pains to have F.B.I. agents observe, on the shelves of chain stores in Atlanta, Chicago, Los Angeles and Washington, D.C., food products of different kinds, a number of which were available both in glass and metal containers

---

[80] Defendants' Exch. N.

and a number only in glass or only in metal. But, except in limited instances, there was no information as to such factors as differences in price, size or quality of the products packed in the containers which were compared. There was no explanation as to why such differences in packing as there were occurred.

There are literally thousands of packers purchasing containers for packing hundreds of food products. The only three packers who were called to testify packed between them only 25 different food products. They represented but a tiny segment of the packing industry and of the products which the industry packed and there was no showing that they were representative. Only eight of the twenty-five products packed by these witnesses were packed in both glass and cans. The small quantity of string beans packed in glass did not sell. A few boiled onions were packed in glass because, for some obscure reason, "eye appeal" was important to certain people purchasing boiled onions. In the case of other of the eight products packed in both glass and cans, only glass was used for consumer sizes and only cans for the large institutional sizes.

The three packers called made it clear that different kinds of machinery and different cooking processes had to be used for packing in glass and packing in cans.

It can scarcely be said that this testimony shows any general interchangeability of use or cross-elasticity of demand as between glass and cans. The fact that in some instances similar products were packaged in two or more different types of containers, or that at times one kind of container has supplanted another in the packing of the same product, does not show that different types of containers are generally commercially interchangeable.

Choice of type of container in which to pack a particular product may be dictated by a variety of factors, including traditional or changing preferences of the buying public, eye appeal, the nature of the trade to be served, the physical characteristics of the product to be packed, the type of packing process required, distance to outlets, and other diverse factors. But the record is barren as to the extent to which specific factors of this nature affect the choice of metal or glass containers in which to pack the enormous varieties and kinds of food products included within the broad range claimed for this product market.[81]

Metal cans and glass containers used for packaging food do not have unique production facilities. The manufacturing equipment and processes and the raw materials for each, far from being interchangeable, are entirely different. Moreover, as has been mentioned, the machinery used to pack food products in glass containers and the packing process are different from that used for packing in metal cans.

There was no evidence to show that the thousands of packers of food products who purchase metal cans or glass containers, or both, fall into any categories of distinct classes of customers. In fact, one of the glaring deficiencies in the Government's proof on this line of commerce, and elsewhere in the case, was its failure to make any detailed inquiry into the customer pattern.

Nor was there any evidence of a distinct price structure for metal cans and glass containers used for food products, or of correlation or correspondence of prices between them. Indeed, the paucity of

[81] For example, ground coffee is packed 99% in cans and paper bags and less than 1% in glass. Soluble (or instant) coffee, on the other hand, is packed 99% in glass and 1% in cans. Catsup is packed in glass for the consumer market and in cans for the institutional market. (Defendants' Exhibit N.) There is no explanation of these differences.

evidence on the subject of prices and pricing practices was another major deficiency in the Government's proof.

There are no specialized vendors of containers used for food products. Can manufacturers and glass manufacturers each sell their own products directly to users who in most instances have multiple sources of supply. There are apparently no jobbers or wholesalers who sell either cans or glass containers, or both.

Much of what has been said concerning a product market consisting of metal and glass containers used to pack all types of foods applies also to a market composed of such containers for hermetically sealed foods only. Such limited examination as was made in this case of the practical indicia for determining whether a product market exists did not establish that there was any line of commerce consisting of metal cans and glass containers used either for packing food products generally or for food products hermetically sealed.

It is therefore scarcely necessary to discuss the question of proof of anti-competitive effects in such product markets. It is sufficient to say that the Government failed to show any reasonable probability of substantial anti-competitive effects or of tendency to monopoly in these areas as a result of the Hazel-Atlas acquisition.

(8) "Containers for the toiletries and cosmetic industry;"

(9) "Containers for the medicine and health industry;" and

(10) "Containers for the household and chemical industry."

In each of these three lines of commerce respectively the Government sought to include, in terms of end use,

glass, metal and plastic containers of every type used by the industry designated. Since such statistics and figures as were introduced to support these lines of commerce are inextricably confused and cut across all of them, and since the problems concerning them are in essence the same, they will be discussed together.

Each of the groups of manufacturers categorized as an "industry" produce a very wide range of products and use containers to package their products of many diverse kinds, shapes, sizes, materials and characteristics. For example, the numerous products packed by a representative group of companies in the toiletries and cosmetic industry include dentifrices, cosmetics, deodorants, face creams, bath salts, lipsticks, face powder, shampoos, colognes, hair dressings, medicated powders, analgesics, hand creams, nail polish, eye shadow, and hair spray. The containers used in packaging such products include glass containers, glass aerosols; metal aerosols, aluminum foil, paper, collapsible metal tubes, including lead and aluminum tubes, brass cases; plastic containers, both squeeze type and others, cloth, cans and paperboard boxes. Glass containers of various kinds are used more frequently than the others.

Manufacturers grouped in what is called the household and chemical industry manufacture an even wider range of products running into the hundreds, if not the thousands. To mention only a few, there are such disparate products as car wax; embalming fluid; insecticides; silver polish; inks; hydrochloric, nitric, sulphuric and other acids; chlorination liquids; rust removers; pet cleaners; weed killers; glue, blueing; and photographic chemicals. The containers used range from small cans to large glass carboys to fibre drums and include a wide range of materials.

What is called the medicine and health industry covers the whole range of medical and health products, including such items as prescription drugs, topical lotions, foot powders, rubbing alcohol, mercurochrome, throat and mouth sprays, eye drops and ear drops, cough syrups and cough drops, first aid kits, absorbent cotton and bandaids. Again the varieties and types of containers used to package the various products produced are extremely wide.

While it is apparent that the number of products produced by each of these industries is exceedingly large and varied, the scope of the respective industries was not shown by the evidence. There were no figures showing the extent of these industries and it cannot be determined which companies or which products are included in them and which are excluded. The statistics in the record do not show either unit or dollar figures for metal or plastic containers used in packaging products in these industries either separately or combined. It is impossible to determine what share Continental or Hazel-Atlas had of the container business in these fields either before or after the acquisition.

The statistical tables of Continental's metal can production include a category covering all non-food products and indicate that in 1955, 1956 and 1957 Continental shipped approximately 30 percent of the total shipments of such containers.[82] This figure includes cans for such products as pet food and motor oil which plainly do not come within the compass of any of the industries with which the three lines of commerce under discussion here are concerned. There was nothing to show what percentage of Continental's non-food metal can shipments fall into these categories nor what the shares of Continental are in the overall

[82] G–801(2f).

shipments of containers for use by these industries. There were no figures at all showing what percentage of plastic containers for these industries were sold or shipped by Continental, though there is an estimate that Continental sold between 7 and 9 percent of polyethylene bottles, tubes, jars and carboys and about 6 percent of the plastic squeeze bottles shipped in 1955.[83]

The three industry classifications used to delineate these lines of commerce were taken from the Bureau of Census categories for the glass industry. The Bureau of Census figures, expressed in totals only, and not broken down by individual companies, were in turn obtained from the Glass Container Manufacturers Institute which used these categories to collect statistics from its members.[84] The Census Bureau used quite different categories in collecting figures for the metal can industry and had no figures at all for the plastics industry.

There were figures indicating that in 1955 Hazel-Atlas shipped about 10 percent of the narrow neck bottles and about 40 percent of wide mouth glass containers for the household and chemical industry. It also shipped about 9 percent of narrow neck glass containers and 28 percent of wide mouth glass containers for the toiletries and cosmetic industry, and about 6 percent of narrow neck and 25 percent of wide mouth glass containers for the medicine and health industry.[85]

But there were no totals for plastic and metal container shipments to these three industries. Nor were there any totals for the combined shipments of glass, plastic and metal containers to them with which to

[83] G–810.

[84] See fn. 28, *supra*, p. 17a.

[85] G–800.

compare the Hazel-Atlas figures, or any showing of what the Hazel-Atlas share of such totals might be.

Apart from its failure to produce evidence showing the size and scope of the product market said to be embraced within these three lines of commerce, the Government also failed to show any other factors establishing that such lines of commerce existed.

There was no public or industry recognition of any such product markets either separately or in combination.

There was no showing that the containers which were sought to be included had peculiar characteristics and uses. The wide variety of sizes, shapes and kinds of containers and of different products packed in them has already been referred to. Plastic containers could not be used at all to package a goodly number of products because plastic is too porous. There are other differences between the products sought to be included such as the use of opal glass jars to package certain types of products and flint glass jars and bottles for others; the peculiar characteristics of the plastic squeeze bottle and of the aerosol type of container; the differences in design, decorative features and fitments of various types of containers; and the differences in weight between glass, metal and plastics. Moreover, there are many other materials used to package products included within these industry categories which are excluded entirely from consideration here without explanation.

It was not shown that the general characteristics and uses of the various types of containers used for packing products in any one of these industries were the same or that their characteristics and uses necessarily differentiated them from containers used in other industries, or, indeed, for other purposes entirely. Containers used by these industries were not

sold or shipped differently from any other containers.

It did not appear that there was any reasonable interchangeability of use or cross-elasticity of demand between containers made of these different materials. It is true that glass container, plastic container and metal container manufacturers are each seeking to promote their lines of containers at the expense of other lines, and that all are attempting to improve their products or to develop new ones so as to have a wider customer appeal. But, as has been pointed out, this, in itself, does not establish reasonable interchangeability.[86]

Here, as in the case of foods, the choice of container may be dictated by a wide variety of factors, as the testimony of the witnesses from companies engaged in the manufacture of toiletries and cosmetics showed. In this field plainly the matter of customer appeal is of paramount importance. The physical characteristics of the product to be packed and the nature of the trade to be served also have a major effect on the choice of a container for a particular product.

It is true that manufacturers from time to time may shift a product from one type of container to another. But there does not appear to have been any general shifting back and forth as between the containers used for a given product. Packaging changes are made only after careful research and investigation and are normally permanent in character. For example, switches for a particular end use from glass to plastic and back from plastic to glass do not appear to occur.

The Government lays some emphasis on the packaging of light duty detergents. Such detergents in powder form were originally packed in paper containers. When light duty liquid detergents were de-

---

[86] See *supra*, pp. 35a–38a.

veloped they were first packaged in glass containers since no other container was functionally suitable. After a modification in the product formula, light duty liquid detergents changed from glass to metal containers. Most of them now are packed in plastic containers and apparently the product has never returned to the container from which it was shifted.

Again, as in the case of foods, the Government introduced evidence as to observations of F.B.I. agents of products on the shelves in chain stores and department stores. These observations indicated that some products were sold in containers made of glass, plastic and metal, some of glass and metal, and some of metal and plastic. Other products, on the other hand, were sold only in one type of container.

But, as in the case of foods, with limited exceptions, no observations were taken as to differences in sizes, prices, or quality of products, the uses for which they were intended, or any other factors which might determine the choice of the container for them. There was no showing that the products packed in containers made of the same material represented any substantial proportion of the total number of products included within these industries. On the contrary, it appears that in the larger stores, at least, there were thousands of products on the shelves which might be classified as sold by these industries and the products found in containers made of the same materials represented only a small proportion of the total.

As to the medicinal and health and household and chemical industries, there was no evidence that there were any distinct classes of customers engaged in purchasing all three types of containers, though some overlap could certainly be expected in view of the great number of different products being packed by these industries.

As to the toiletries and cosmetic industry, certainly the principal toiletry and cosmetic manufacturers normally purchased all three types of containers. This again was to be expected in view of the large number of different kinds of products which they packaged and is of no particular significance in the line of commerce context.

There was no distinct price structure for the three kinds of containers included within these lines of commerce. It appears that plastic containers have been and remain considerably more expensive than glass containers. While a number of toiletry and cosmetic manufacturers take some account of differences in prices between the various kinds of containers, as they would be expected to do, it does not appear that this is a dominant or controlling factor in selling a container for a particular product. While manufacturers of one type of container pay some attention to the prices of other types, it was not shown that there was any correlation or correspondence of prices between the three types of containers.

There is no evidence that there are any specialized vendors for containers of these types. Manufacturers sell their own products directly to users who appear to have multiple sources of supply.

Here again the Government failed to establish the lines of commerce which it specified either separately or in combination. There is no showing that there are any product markets consisting of metal, plastic and glass containers for use by the toiletry and cosmetics, medicine and health, or household and chemical industries. Inter-industry competition between plastic, metal and glass manufacturers in the sale of containers to package some products included within these industries there no doubt is, but separate relevant product markets in the anti-trust sense were not shown to exist.

Again, since no lines of commerce have been established there is no necessity for discussing the Government's claims as to anti-competitive effects of the acquisition in such lines. It should be said, however, that none of the numerous witnesses representing toiletry and cosmetics manufacturers or the representative of the largest plastics container manufacturer who testified with respect to these lines of commerce, indicated that the Hazel-Atlas acquisition had had or was likely to have any effect of any kind on their own businesses or generally. All gave a picture of healthy competitive conditions both before and after the acquisition with no suggestion of any anti-competitive effects or tendency to monopoly.

VII

CONCLUSION

The evidence in the record at the close of the Government's case has been weighed not only as a whole but as to each of the ten lines of commerce on which the Government relied until the end of the trial, as to such possible alternative lines as the Government suggested after its case had been concluded, and as to any other product markets which may have existed. Such inferences have been drawn from the evidence on each aspect of the case as were reasonably justified.

After doing so, I concluded that the proof submitted by the Government established only three of the ten lines of commerce or relevant product markets which it attempted to delineate in this case—the metal can industry, the glass container industry and containers for the beer industry. As to these product markets I found that there was no proof of any reasonable probability of substantial anti-competitive effects or tendency to monopoly in any of them as a result of the acquisition of Hazel-Atlas by Continental.

I also concluded that the proof failed to establish that any of the other lines of commerce which the Government delineated or suggested were in fact relevant product markets or sub-markets. In addition, I concluded that there was no evidence in the record establishing any relevant product markets or sub-markets other than those relied upon or suggested by the Government.[87]

Moreover, even assuming that any such product markets existed, I have found there was no proof of any reasonable probability of substantial anti-competitive effects or tendency to monopoly as a result of the acquisition in any of them.

Thus, the Government wholly failed to sustain its burden of proof in this case.

Some measure of its failure of proof here can be gathered from a comparison with the proof adduced in the *Brown Shoe* case. I do not mean by this to suggest that the proof in *Brown Shoe* sets any minimal standards for determining Section 7 violation. However, such a comparison is illustrative of the deficiencies in the Government's proof in the case at bar.

The *Brown Shoe* case involved a merger, both horizontal and vertical, of two companies in a single, well-recognized, separate industry. In the case at bar, on the other hand, the merging companies were each in

---

[87] I found that vacuum type closures and screw and lug type closures while not forming a product market in combination, each constituted a separate product market. These products did not compete with one another to any significant degree. Their respective product markets were not areas of effective competition in the context of this case and were not "relevant" in that sense. (See pp. 63a–65a, *supra*.)

The plastic container industry was a recognized separate industry (see pp. 25a–27a, *supra*) and may constitute a separate product market. However, the Government made no attempt to establish such a relevant product market here.

different industries and the merger was almost entirely of a conglomerate nature. I have already pointed out the different problems presented by conglomerate mergers and horizontal or vertical mergers, the difficulties of proof in a conglomerate case and the necessity in such a case for detailed examination of all of the factors which might bear on relevant product markets and anti-competitive effects within them.[58]

In the light of the differences between the two types of cases, it is particularly significant that the proof in *Brown Shoe* which impelled the Court to strike down the acquisition there, went far beyond the proof adduced in the case at bar.

For example, in *Brown Shoe* there was "[t]estimony in the record from numerous independent retailers, based on their actual experience in the market, demonstrat[ing] that a strong, national chain of stores can insulate selected items from the vagaries of competition in particular locations and that the large chains can set and alter styles in footwear to an extent that renders the independents unable to maintain competitive inventories."[59] There was also evidence "that [the merger] creates a large national chain which is integrated with a manufacturing operation. The retail outlets of integrated companies by eliminating wholesalers and by increasing the volume of purchases from the manufacturing division of the enterprise can market their own brand at prices below those of competing independent retailers."[60]

Moreover, the proof in *Brown Shoe* established lines of commerce within a single industry, well recog-

[58] *Supra*, p. 40a.

[59] *Brown Shoe Co.* v. *United States*, *supra*, at p. 344.

[60] *Ibid.*

nizable in terms of the commercial realities. There was detailed testimony as to specific and demonstrable anti-competitive effects in each of these lines of commerce in specifically defined economically significant geographic markets.

It was on evidence of this nature, taken in conjunction with proof of the market shares held by the combining companies and the trend toward concentration in the industry, including Brown Shoe's own part in that trend, that the Court found that the Brown Shoe-Kinney merger violated Section 7.

Here, in contrast, seven of the ten lines of commerce which the Government attempted to carve out were artificially contrived and were neither recognized as separate product markets nor comported with market realities. Beyond this, as to no product market in the case at bar was there evidence from competitors in the relevant industries, from buyers of the products involved, or from any other sources, that there was reasonable probability of any anti-competitive effects, substantial or otherwise, or any tendency to monopoly as a result of this acquisition.

Lacking evidence to sustain its burden, the Government speculated as to what might happen as a result of the acquisition. In the light of the record these speculations were at best mere possibilities. There was no proof of reasonable probability that such anti-competitive effects as the Government foresaw were likely to occur or that, if any of them did occur, they would be substantial.

It has been said that "* * * mergers are a common form of growth; they may lessen, increase, or have no effect upon competition. A merger as such involves no necessary connotations of coercion, dominance or lack of effective competitive pressures."[21]

[21] Report of the Attorney General's National Committee to Study the Anti-Trust Laws, March 31, 1955, p. 124.

As far as the record here shows the merger under scrutiny in this case had no such connotations and, in fact, had no significant effect upon competition in any product market. This merger was not shown to be one of those proscribed by Section 7 of the Clayton Act.

Thus, at the end of the Government's case it was apparent that the Government had not succeeded in establishing any violation of Section 7. Defendants were therefore entitled to judgment which will be entered accordingly.

This opinion constitutes my findings of facts and conclusions of law in this case pursuant to Rule 52(a), F.R.C.P.

It is so ordered.

Dated: New York, N.Y., April 15, 1963.

FREDERICK VAN PELL BRYAN,
U.S.D.J.

Final Judgment

The issues in the above entitled action having regularly been brought on for trial before the Honorable Frederick van Pelt Bryan, United States District Judge on June 13, 14, 15, 16, 17, 20, 21, 22, 23, 24, 27, 28, 29, 30, July 1, August 12, October 3, 4, 5, 6, 10, 11, 13, 14, 17, 18, 19, 20, 24, 25, and December 9, 1960, and the Court having handed down its opinion constituting its findings of fact and conclusions of law on April 16, 1963, it is

Adjudged: That the defendants have judgment against the plaintiff.

Dated: New York, N.Y., April 16, 1963.

/S/ James E. Valeche,
Clerk.

Judgment entered April 16, 1963.

IN THE

Supreme Court of the United States

OCTOBER TERM, 1963.

No. 367

UNITED STATES OF AMERICA, Appellant,

v.

CONTINENTAL CAN COMPANY, INC. and HAZEL-ATLAS GLASS COMPANY.

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE SOUTHERN DISTRICT OF NEW YORK.

MOTIONS TO DISMISS OR AFFIRM.

Appellee, Continental Can Company, Inc., pursuant to Rule 16 of the Revised Rules of this Court, moves 1) that the appeal be dismissed because not taken in conformity with the Rules of this Court, or in the alternative 2) that the final judgment of the district court be affirmed on the ground that it is manifest that the questions on which the decision of the cause depends are so unsubstantial as not to need further argument.

Statement.

This is a direct appeal from the judgment of the district court holding that the acquisition of Hazel-Atlas Glass Company (Hazel-Atlas) by Continental Can Company, Inc.

(Continental) did not violate Section 7 of the Clayton Act, 15 U. S. C. 18.

The government's complaint was dismissed by the district court because of a failure of proof of either actual anti-competitive effects flowing from the acquisition or reasonable probability that the forbidden anti-competitive effects would result in the future.

The district court rendered an opinion in which it made meticulous findings of fact and carefully and correctly applied the law, including *Brown Shoe Co.* v. *United States*, 370 U. S. 294 (1962), which was decided by this Court after the completion of the government's case but before the district court filed its opinion and order.

It is appellee's position that the appeal should be dismissed because, contrary to the Rules of this Court, the government's Jurisdictional Statement is based in substantial and material part upon material which, although referred to in the Jurisdictional Statement as part of the record, is not a part of the record and was not offered or received in evidence.

It is, further, appellee's position that the judgment of the district court is clearly correct, that it is fully supported by the evidence of record and the decisions of this Court and that no substantial question of law is presented by the appeal.

Appellee therefore moves that the appeal be dismissed, or, in the alternative, that the judgment below be affirmed without further briefing or oral argument.

The Acquisition

Continental acquired all of the assets and assumed all of the liabilities of Hazel-Atlas on September 13, 1956. Since that date the acquired business has been operated by Continental. Hazel-Atlas was dissolved late in 1956.

Prior to the acquisition, Continental's principal business was the manufacture and sale of metal cans and other metal containers. Other products included paper cups and plates, fibre drums, kraft linerboard, flexible packaging materials, crown caps, vacuum type metal caps, plastic containers and can closing machinery. It did not manufacture or sell any glass products or other product manufactured or sold by Hazel-Atlas (App. 13a).[1]

Continental was formed in 1913. In common with many American corporations it grew over the years by both internal growth and outside acquisitions.

The district court considered the evidence relating to prior acquisitions and found:

> "Many of the acquisitions were made a number of years ago in the 1920's and the 1930's. Many were extremely small. Some were the result of liquidation sales. Some appear to have been cleared with the Department of Justice or to have had its tacit approval. Some were located in Canada. Some of the companies acquired were subsequently sold.
>
> "None of the companies acquired in the ten years prior to suit were can companies. No glass company had ever been acquired before" (App. 43a).

The government does not challenge these findings.[2]

---

[1] References to the district court's opinion are to the Appendix to the Jurisdictional Statement. To avoid confusion the appendices to these motions are designated Appellee's Appendix 1 and Appellee's Appendix 2. The government's Jurisdictional Statement is referred to herein by the abbreviation "J. S.".

[2] In its Jurisdictional Statement the government refers to the acquisition of White Cap Company and states that in 1958 it had "approximately 60% of the production and shipment of all vacuum closures made from tin plate" (J. S. 5, n. 3). The reason for including this statement in the Jurisdictional Statement is not clear; in any event it is meaningless unless considered in connection with the structure of the industry of which metal vacuum closures are a part. The government has excluded this subject from the appeal (J. S. 6, n. 6).

Hazel-Atlas was a company manufacturing and selling glass containers both for home and commercial use, glassware, including tumblers, tableware and kitchenware, some types of metal closures for glass containers and miscellaneous items. It did not manufacture or sell metal containers or any other product made or sold by Continental (App. 13a).

The Proceedings Below

When the proposed acquisition was announced in the summer of 1956, the government attempted to stop it by invoking an existing decree to which Continental was a party. When the district court which had entered that decree held that it did not apply to the proposed acquisition,[3] the government obtained the voluntary agreement of the companies to postpone the acquisition until the government could apply for a temporary restraining order. Shortly thereafter a complaint charging violation of Section 7 of the Clayton Act was filed in the District Court for the Southern District of New York, and application was made by the government for a temporary restraining order. This application was denied on September 13, 1956, and thereupon the acquisition was completed.

The action was continued as an action for divestiture. Extensive pretrial proceedings, involving both elaborate discovery and pretrial conferences, were conducted and the government presented its case in a trial lasting six weeks. During the trial the government called numerous witnesses, took over 4,000 pages of testimony and introduced hundreds of exhibits, among which were elaborate statistical computations. With very few exceptions everything the government offered was admitted in evi-

[3] *United States* v. *Continental Can Company*, 143 F. Supp. 787 (N. D. Cal. 1956).

dence. The government does not complain of the exclusion of the few items offered which were not admitted.

On the conclusion of the government's case Continental moved for a dismissal of the complaint under Rule 41(b) of the Federal Rules of Civil Procedure.

The district court, correctly applying Rule 41(b), proceeded to evaluate the evidence to determine whether on the facts presented the government was entitled to relief. Finding that it was not, the court orally announced its decision to dismiss the complaint.

This Court decided *Brown Shoe Co.* v. *United States*, 370 U. S. 294 (1962) before the district court completed the preparation of its written opinion, findings of fact and conclusions of law. Very shortly after the *Brown Shoe* decision was rendered, the government requested and received permission to file with the district court an additional brief discussing the applicability of *Brown Shoe*. This was done and appellee responded. Judgment dismissing the complaint was entered on April 16, 1963.

The district court's opinion covers 95 printed pages. Each of the government's contentions is carefully analyzed and comprehensive findings are made with the greatest of care. Scrupulous attention is given to the teachings of *Brown Shoe* and other relevant decisions of this Court.

The district court found no fault with the legal theories advanced by the government. It based its conclusions squarely on the finding that the evidence showed no actual anti-competitive effects from the acquisition and showed nothing from which it could be concluded that there was a reasonable probability that the forbidden anti-competitive effects would develop in the future. The complaint, in short, was dismissed because the government failed to support its allegations with proof.

Argument—Motion to Dismiss Appeal.

Rule 13 of the Revised Rules of this Court provides that upon filing in this Court of the record brought up by appeal, the appellant shall file a statement as to jurisdiction, which shall comply in all respects with Rule 15.

Rule 15 provides that the Jurisdictional Statement shall contain: "a concise statement of the case containing the facts material to the consideration of the questions presented."

It is implicit that the statement of facts shall be a fair statement based on the record.

The government's Jurisdictional Statement is based in substantial part on material which, although referred to in the Jurisdictional Statement as exhibits, was neither offered nor received in evidence.

The first item in question is referred to in the Jurisdictional Statement as "GX 636". No such exhibit was offered or received in evidence. The government at page 15 of its Jurisdictional Statement quotes from "GX 636" at length. The same reference is cited at pages 14 and 23 of the Jurisdictional Statement.

On page 18 of its Jurisdictional Statement, the government cites material which it refers to as "GX 415A". The reference is later repeated on the same page. No such exhibit was offered or received in evidence.

On page 18, also, of its Jurisdictional Statement the government cites material which it refers to as "GX 418" and "GX 421". No such exhibits were offered or received in evidence.

On page 19 of its Jurisdictional Statement, the government cites material which it refers to as "GX 774". No such exhibit was offered or received in evidence.

On page 19, also, of its Jurisdictional Statement the government cites as a group "GX 1-131". Out of this group the following were neither offered nor received in evidence:

GX 4	GX 19
GX 5	GX 20
GX 6	GX 21
GX 7	GX 22
GX 8	GX 23
GX 9	GX 25
GX 10	GX 26
GX 11	GX 27
GX 12	GX 28
GX 13	GX 29
GX 15	GX 30
GX 17	GX 32
GX 18	GX 41

All of the above material was material which was assigned identification numbers before the trial. After the appellee—the defendant below—advised the government that it would object to such material as unreliable, the government chose not to subject it to the test of admissibility, and it was not offered. The government should not now be heard to rely on material which it did not offer at the trial.

On page 17 of its Jurisdictional Statement the government cites material which it refers to as "GX 414". The reference is to a document which was offered at the trial and excluded (Tr. 3553-3554).

The Jurisdictional Statement, being based upon and replete with references to material which is not in the record, is not in accordance with the Rules of this Court and should be rejected. Accordingly, the motion to dismiss the appeal should be granted.

Argument—Motion to Affirm.

The Government's Questions

The first question which the government raises on its appeal: "whether mergers eliminating 'interindustry' competition are subject to Section 7 of the Clayton Act" is fictitious. Appellee never contended below, and the district court did not hold, that mergers eliminating interindustry competition were not subject to Section 7. The district court held that the existence of such competition "is not *determinative* of the metes and bounds of a relevant product market" (App. 36a; emphasis added), and that lines of commerce in a Section 7 case must be defined by applying the various criteria established by the decisions of this Court and recently synthesized in *Brown Shoe*. It thereupon proceeded to apply those criteria to the facts and found that metal cans and glass containers together did not constitute a single line of commerce (App. 36a-37a). In making this factual assessment, the court below pointed out that the government had failed to distinguish "between inter-industry or overall commodity competition and the type of competition between products with reasonable interchangeability of use and cross-elasticity of demand which has Clayton Act significance" (App. 37a).

But the court did not stop there. It went on to consider whether the prohibited anticompetitive effects (actual or probable) had been shown in this market setting of interindustry competition. It specifically recognized that conglomerate mergers (*i.e.*, mergers of companies engaged in different industries) are covered by the statute where such effects are shown (App. 40a). Here no such effects were shown. This case, therefore, does not present the issue posed by the first question.

The second question which the government raises: "whether, in order to prove that a merger may substantially lessen competition, the government must in every case use statistical evidence of market shares in a defined product market" is equally fictitious. Appellee never contended below, and the district court did not hold, that the use of statistical evidence of market shares was a necessary requirement. It was the government that elected to try its case on the basis of statistical, and virtually no other, evidence. It was the government that tried to define, by statistics, an unknown product line. And it was the district court that tried, and tried hard, to use the statistics presented to it. As will be shown, *infra*, the government's statistics were no good, and even on this appeal the government is forced to abandon the statistics that it offered below in support of its claimed canning line of commerce and fall back on more general statistics which, in turn, are thoroughly unreliable. Confronted with this confusing hodgepodge of statistics, the district court nevertheless gave them the benefit of every doubt and adjudicated the issue of competitive effects on the basis of *all* the evidence in the case, making such use as it could of the government's statistics. Here again, this case does not present the issue posed by the government's question.

The only question in this case is the third posed by the government. It is strictly factual and plainly unsubstantial: "whether the district court erred in concluding that the government had failed to show that this merger would substantially lessen competition in the market for containers for food canning". This is simply an attempt by the government to substitute this Court for the trier of the facts. It presents no substantial question of which this Court should take cognizance. This Court should not be asked to retry a case that an experienced district judge

has tried with care and skill, and rendered a judgment that is clearly correct.

The situation here is comparable to that in *United States* v. *Yellow Cab Co.*, 338 U. S. 338 (1949) in which this Court, in refusing to retry an anti-trust case, concluded at 340-41:

> "The judgment below is supported by an opinion, prepared with obvious care, which analyzes the evidence and shows the reasons for the findings. To us it appears to represent the considered judgment of an able trial judge, after patient hearing, that the Government's evidence fell short of its allegations—a not uncommon form of litigation casualty, from which the Government is no more immune than others."

Lines of Commerce

Section 7 is applicable by its terms to substantial anti-competitive effects in "any line of commerce".

This Court has clearly recognized the necessity of delineating lines of commerce within which to measure the effects of a merger. In *United States* v. *E. I. duPont de Nemours & Co.*, 353 U. S. 586 at 593 (1957), this Court observed:

> "determination of the relevant market is a necessary predicate to a finding of a violation of the Clayton Act because the threatened monopoly must be one which will substantially lessen competition 'within the area of effective competition.' Substantiality can be determined only in terms of the market affected."

This statement was repeated in *Brown Shoe* (370 U. S. at 324), which also further elaborated on the criteria to be applied in defining the relevant product market or markets.

Notwithstanding the statute and the pronouncements of this Court, the government would reduce the product market inquiry—the critical threshold question in any Section 7 case—to a "customary" ritual (J. S. 11).

In defining the pertinent lines of commerce in this case, the district court scrupulously applied the tests established by the decisions of this Court and made detailed findings of fact fully supporting its market definitions.

The government originally proposed ten lines of commerce.[1] Each of these was considered in minute detail by the district court. It found that only three of them—glass containers, metal cans, and containers for beer—did, in fact, constitute separate lines of commerce.

That the district court clearly understood and properly applied the criteria specified by this Court for determining lines of commerce and appraising competition between products, whether in the same industries or in different ones, is demonstrated by its findings with respect to beer containers. Here the district court evaluated the evidence and found that a *prima facie* showing had been made that glass containers for beer and metal containers for beer constituted a single line of commerce notwithstanding the fact that they were made and sold by different industries. This finding was based on evidence which the district court considered to show "virtual interchangeability of use and cross-elasticity of demand between the two types of containers used for this purpose" [i.e., beer] (App. 66a). Having found such a line of commerce, the district court proceeded to evaluate the effect of the acquisition in it and

[1] 1. Containers for the canning industry. 2. Containers for the beer industry. 3. Containers for the soft drink industry. 4. Containers for the toiletries and cosmetics industry. 5. Containers for the medicine and health industry. 6. Containers for the household and chemical industry. 7. The can industry. 8. The glass container industry. 9. Metal closures. 10. The packaging industry.

found no reasonable probability that the acquisition would adversely affect competition in that line of commerce (App. 68a-70a). The district court's opinion plainly shows that the same methodology was followed with respect to every other line of commerce claimed by the government, including its alleged "interindr ry" lines, and, specifically, metal cans for food and glass containers for food.

It is perfectly apparent why the district court found that metal cans for food and glass containers for food, unlike metal and glass containers for beer, did not constitute a single line of commerce. Beer is beer. But one food product is not the same as another. Nor are their packaging needs the same. Sardines and mayonnaise are both food. But sardines traditionally move in metal cans, and the housewife traditionally buys mayonnaise in glass containers (DX-N). Or take the case of two varieties of a single food product—coffee. Ground coffee is packed 99% in metal cans and paper bags, and less than 1% in glass; whereas soluble (or instant) coffee is packaged 99% in glass and 1% in cans (App. 82a, n. 81). Then, again, consider the case of catsup. This food product is packed in glass for consumer usage and in cans for institutional usage (*ibid.*).

At the trial one of the *government's* expert witnesses estimated the extent to which various products are packaged in one type of container or another. His estimates, contained in DX-N, are reproduced herein as Appellee's Appendix 1 to this motion. They demonstrate that it would defy the realities of the market place to lump metal cans together with glass containers in a single food canning line of commerce. As the district court observed:

> "Choice of type of container in which to pack a particular product may be dictated by a variety of factors, including traditional or changing prefer-

ences of the buying public, eye appeal, the nature of the trade to be served, the physical characteristics of the product to be packed, the type of packing process required, distance to outlets, and other diverse factors" (App. 82a).

In rejecting the government's food canning line of commerce, the district court specifically found, after an exhaustive review of the evidence, that there was "no showing of reasonable interchangeability of use or cross-elasticity of demand as between metal and glass containers used for packing food" (App. 80a); that there was "no showing of any public or industry recognition of such a product market or sub-market" (App. 79a); that metal cans and glass containers do not have the same physical characteristics and uses in the food field (App. 80a); that "their shapes, sizes and other characteristics differ widely, depending upon the type of food to be packed in them" (*ibid.*); that "the manufacturing equipment and processes and the raw materials for each, far from being interchangeable, are entirely different" (App. 82a); that "the machinery used to pack food products in glass containers and the packing process are different from that used for packing in metal cans" (*ibid.*); that "there was no evidence to show that the thousands of packers of food products who purchase metal cans or glass containers, or both, fall into any categories of distinct classes of customers" (*ibid.*); that there was no evidence of "a distinct price structure for metal cans and glass containers used for food products, or of correlation or correspondence of prices between them" (*ibid.*); and that "there are no specialized vendors of containers used for food products" (App. 83a).

The district court, in short, went down the line of product market indicia outlined by this Court in *Brown Shoe*, and found the government's case deficient on each and

every score. One will read the Jurisdictional Statement in vain for any showing that these findings were incorrect, much less clearly erroneous (Rule 52(a)).

In addition to these findings negating the government's canning line of commerce, it should be noted that although Hazel-Atlas and Continental both sold their respective containers for food, they sold them for different uses.

The principal glass containers manufactured and sold by Hazel-Atlas for use as food containers were for use in packaging catsup, chili sauce, vinegar, syrup, salad dressing, jams, preserves, pickles, mayonnaise, maraschino cherries, olives and mustard (Tr. 879).

These products do not move in metal cans, except that a small amount of certain types of syrup is in cans. Catsup, chili sauce, salad dressing and mayonnaise in retail sizes are practically unknown in containers other than glass. The same is true of the other principal foods for which Hazel-Atlas sold glass containers—vinegar, jams, preserves, pickles, maraschino cherries and mustard (DX-N). Baby food containers, to which the government refers (J. S. 18), was a use for which Hazel-Atlas's participation was negligible.[5]

On the other side, the principal food products for which Continental sells its metal cans do not move in glass containers. Continental's largest food container lines are for fruits and vegetables, including juices (GX 880). Much of the fruit juice is packed concentrated in frozen form for which glass containers are not suitable. With respect to fruits and vegetables generally, cooking time, weight,

[5] The government's Jurisdictional Statement (J. S. 18) gives figures purporting to show the consumption of baby food containers and the division of such containers as between cans and glass containers. As a source of its figures the government cites a document which it refers to as "GX 415A." No such document was offered or received in evidence.

appearance and other market factors militate so heavily against glass containers that in practice only small amounts of premium grades are packed in glass containers (Tr. 766-69, 1112-13, 1124, QX 317, GX 318). In total, these are negligible (DX-N).

Other major food products for which Continental sells metal cans are evaporated milk, fish and seafood, coffee, meat and lard and shortening (GX 800). Here also, for a host of different reasons, some applying to one product and some to another, these products are, and continue to be, packaged in cans. Sometimes it is weight, often it is appearance and very frequently it is the very nature of the processing to which the product is subjected which determines that a metal container is the only practicable container to use.

In pretrial proceedings the government claimed that all packaging materials constitute a single line of commerce. This position was not pressed at the trial and has been abandoned. The interindustry competition to which it now refers, however, is by no means limited to glass containers and metal cans. Included also is competition of paper, plastics, and other packaging materials. Although the government is forced to recognize this in its Jurisdictional Statement (J. S. 11) it would now ignore everything except metal cans and glass containers.

The evidence on the question of whether metal cans and glass containers can be forced into the same product market can best be summarized in terms of the "practical indicia" referred to in *Brown Shoe*.[6]

Industry and public recognition

The can industry and the glass container industry are separate and well defined. Each has its own trade

[6] 370 U. S. at 325.

association and the Bureau of Census collects statistics relating to them separately (Tr. 1018, 2013, GX 800, pp. 5-21, GX 801, Table A, 2a-2f). The business world and the public recognizes them as separate industries and markets. There are no combined statistics available (Tr. 2941-42).

The product's peculiar characteristics and uses

Cans and glass containers are made of different materials and have different physical characteristics (App. 14a, 16a). While in some instances it may be physically possible to package products in either type of container, other forces, including tradition, weight, price, attractiveness and many others determine which container is customarily used (Tr. 665, 1080-81, 1116, 2111-12). This was graphically demonstrated by the estimates of the government's own expert (Tr. 2008, 2100-02, 2105-06A, DX-N).

Unique production facilities

Can and glass container manufacturing equipment is not interchangeable (DX-K, cover letter, p. 5). From the user's point of view it is not feasible to use a canning line designed for packing a product in cans to pack a product in glass containers or vice versa (Tr. 781, 1107, 1122-25).

Distinct customers

There was no evidence to show that purchasers of metal cans or glass containers, or both, fall into any categories of distinct classes of customers (App. 82a). The purchasers do not pack the same product in different containers (DX-N).

Distinct prices

Glass containers and cans are priced separately. The prices of cans are determined principally by the price of tinplate; those of glass containers principally by the cost of labor (Tr. 444, 484, 1002-03).

Sensitivity to price changes

Prices of one type of container are not changed in response to price movements of the other type (Tr. 444, 515, 733, 946, 964).[7] Manufacturers of one type of container frequently do not even know the price at which the other type of container is being sold (Tr. 946, 964). The record does not indicate that buyers shift their purchases from one type of container to the other because of changes in the price differential between the two.

Specialized vendors

Can manufacturing companies sell cans and glass container companies sell glass containers. Sales are normally made directly to users (Tr. 945). The evidence gives no hint of the existence of jobbers or wholesalers who sell both cans and glass containers, and the reason, of course, is that such persons could not be found.

Against this evidence the government still contends that cans and glass containers are somehow in the same product market. For this it relies primarily on studies made by a market study group within Continental of the possibility of putting certain food products which customarily move in glass containers into cans (J. S. 17-18).[8] The limited nature of such studies is shown by the gov-

---

[7] The government's Jurisdictional Statement (J. S. 19) states that Hazel-Atlas considered the cost of metal containers in determining its own price. There is no such evidence in the record. In support of its statement the government cites (J. S. 19) a document which it refers to as "GX 774". No such document was offered or received in evidence.

[8] The government's Jurisdictional Statement (J. S. 18) also states that consideration was given by Continental to containers for wine and cites in support of that statement a document which it refers to as "GX 421". No such document was offered or received in evidence.

ernment's description of them. The government's own quotations from them (J. S. 17, n. 13) show that they were predicated on the development of cans which were not in existence. Many of them relate to experiments with aerosol containers. That they changed nothing in terms of market usage is clearly shown by DX-N. The few other documents referred to proved no more. Most of the Glass Container Manufacturers' Institute studies referred to on page 19 of the government's Jurisdictional Statement relate to beer containers, which the district court found to be a line of commerce, but one in which Hazel-Atlas' activities were almost non-existent (App. 65a, 68a). Most of the Can Manufacturers' Institute documents referred to on pages 19-20 of the government's Jurisdictional Statement relate to general research with respect to the use of cans. The district court properly found that this evidence did not show reasonable interchangeability or cross-elasticity of demand as between metal cans and glass containers generally.

Prior to the trial, also, the government proposed a "canning" line of commerce which it then defined as relating to containers for heat-sterilized and hermetically sealed foods. At the trial it limited this line to hermetically sealed foods, although some of the foods it claimed fell within this line were heat-sterilized but not hermetically sealed, some were hermetically sealed but not heat-sterilized, and some were neither.[9] See App. 77a, n. 79.

The government's confusion as to what it means to include within its "canning" line is complete. In its Pretrial Statement of proposed "Steps of Proof" it defined it as ". . . fruits, vegetables, juices and other foods which

[9] In its Jurisdictional Statement (J. S. 15-16) the government quotes extensively from an alleged exhibit which it refers to as "GX 636". No such exhibit was offered or received in evidence.

are heat-sterilized and hermetically sealed in cans and glass containers."

In oral argument on the motion to dismiss counsel for the government said (Tr. 4101): ". . . when we attempted to define this in our answer to interrogatories, we attempted to define it in this manner to explain what we were talking about and what we were trying to exclude, and the key thing is we were trying to include things which are hermetically sealed. We used the words 'heat sterilization' because we are trying to get away from frozen food." In response to questions from the district court, government counsel said that candy and baking powder in screw top containers (i.e., containers which are not hermetically sealed) would be included. The district court then said (Tr. 4109):

> "The Court: In other words, your contention now—I want to make sure I get this—your contention at the present time is that your line of commerce on food includes all foods that are packaged in tin or glass."

To this government counsel replied (*ibid.*):

> "That would be correct."

In an affidavit in support of a motion for reargument made just after the trial, government counsel said:

> ". . . our definition of the canning line included products which were not heat sterilized and in essence represented all foods which were put in hermetic containers." (McManus affidavit, Dec. 21, 1960, p. 3).

In the same affidavit (p. 5) government counsel said:

> "By its [the government's] direct examinations and by its documentary evidence it left no doubt

that the 'canning' line included non-heat sterilized foods."

The district court dealt with this confusion in its opinion. See App. 78a.

On this appeal the government has reversed its position again, and it now would limit the line to foods which are both hermetically sealed and heat-sterilized (J. S. 14-15).

On this appeal the government contends that one physical fact alone—the possibility of creating a hermetic seal on a container which can be heat-sterilized—is sufficient to create a line of commerce. It would ignore all other market factors which were shown at the trial to negative completely the existence of a line of commerce consisting of containers for canning.

A line of commerce consisting of containers for hermetically sealed and heat-sterilized foods is not known in everyday use and the evidence does not permit one to be discovered.[10] The government's two experts did not recognize such a line. The government's food expert testified that food processing for glass packing was different from that for metal can packing; that packing techniques for different types of containers were different; that packing economics were different; that the equipment required was different; and that the physical characteristics of the two types of containers produced different packing results (Tr. 765-70, 780-81A, 785-86). The government's other expert testified that specified products tend to move

[10] At page 11 of its Jurisdictional Statement the government states that it will be shown later in the Jurisdictional Statement that market shares of "containers for food canning" were proved. In the subsequent discussion referred to, however, the government admits (J. S. 22-23) that it has no figures to show market shares and attempts to create some by indulging in supposition and by using "GX 636", a document not offered in evidence.

in containers of one type or the other but not in both (Tr. 2100-02, 2105-06A, DX-N).

The government points to what it calls "the most graphic evidence of the interchangeability between glass and metal containers in the food canning market: numerous food products packed in both containers", and says that observations showed the same products offered for sale competitively in both glass and metal containers (J. S. 16).

The reference is to certain products purchased by FBI agents in retail stores. So far from showing that the products were offered for sale "competitively", it was stipulated at the trial (Tr. 2697-2701) that no attempt had been made to determine if the products were offered competitively. They are not the same products; they are not processed in the same way; and they are not priced competitively. A copy of the stipulation is annexed as Appellee's Appendix 2.

An examination of the government's examples of food products packed in both types of containers generally shows immediately what the differences were: green olives were packed in glass—ripe olives in cans; fruit preserves packed domestically were packed in glass containers—fruit preserves packed abroad and imported were packed in cans; tomato catsup in retail sizes was packed in glass containers—tomato catsup in institutional sizes was packed in cans.

Upon all of this evidence the district court found no reasonable interchangeability or cross-elasticity of demand as between cans and glass containers for packaging food. This finding was clearly correct.

Anti-Competitive Effects

The district court construed the words "may be", used in Section 7 in defining the ~~effect on competition~~ of mergers, as the equivalent of reasonable probability (App. 6a).

There is no doubt that this is correct. The Senate Report on the bill which became Section 7 says, with respect to the words "may be": "The use of these words means that the bill, if enacted, would not apply to the mere possibility but only to the reasonable probability of the prescribed effect." (S. Rep. No. 1775, 81st Cong. 2d Sess. 6; *Brown Shoe*, 370 U. S. at 323).

Although the present case was tried more than four years after the acquisition, there was no proof of actual anti-competitive effects. The government does not dispute this.

The inquiry then becomes one of the reasonable probability of the future development of anti-competitive effects where no such effects have developed in four years.

From the mere existence of interindustry competition in general in the sale of cans and glass containers, and the position of Continental and Hazel-Atlas in their respective industries, the government argues that an inference should be drawn that the effect of the acquisition may be substantially to lessen competition (J. S. 13). Here the government seizes upon half a sentence in *United States v. Philadelphia National Bank*[11] and tears it out of context.

The factual situation in *Philadelphia Bank* was completely different from that in the present case. There, both parties to the merger were direct competitors in the same line of commerce (commercial banking), so the merger was plainly a horizontal one. The merger would have produced a bank controlling an undue percentage of the relevant market and would have significantly increased the high degree of concentration that already prevailed in an industry which had witnessed a decline in the number of competitive units. It was in this context that the Court made its comments with respect to the inherent likelihood

[11] 374 U. S. 321, 365 (1963).

of the effects of that merger. There is no parallel whatever between the *Philadelphia Bank* case and the merger at issue here, which involves diversification by one company into a new product line.

In the present case the government contends that the interindustry competition was such as to make unavoidable an appraisal of the effects of the merger on this competition (J. S. 9). But that is precisely what the district court did. Although it found no single line of commerce comprising all metal cans and glass containers, and no line of commerce consisting of containers for canning, the district court proceeded to make a very careful and complete appraisal of the effect of the acquisition in every direction. Each of the areas in which the government contended that anti-competitive effects might arise was considered separately. The thoroughness of this study is indicated by the areas considered:

(a) Prior acquisitions (App. 42a).

(b) Intention of the parties (App. 44a).

(c) Likelihood of suppression of product lines (App. 45a).

(d) Elimination of competition (App. 45a, 55a, 62a).

(e) Weakening of either company in their respective lines (App. 45a).

(f) Advantages resulting from the acquisition (App. 46a, 54a, 61-62a).

(g) Concentration in the respective industries (App. 47a).

(h) Changes in market position (App. 48a).

(i) Effects on competitors (App. 49a).

(j) Ease of entry into industries involved (App. 55a, 58a).

(k) Tendency toward monopoly (App. 57-58a).

This careful inquiry yielded nothing to show a reasonable probability that the acquisition would have the prohibited anti-competitive effects. There was a total failure of proof that this interindustry merger was likely to adversely affect competition in either industry or in any other line of commerce claimed by the government.

The Government's Statistics

Although the government deprecates reliance on statistics, it uses a great many of them in its Jurisdictional Statement in an attempt to show what Continental's and Hazel-Atlas' positions would have been if metal cans and glass containers or metal cans and glass containers for foods or for canning could have been combined into a single product market.

Its statistical methodology is such, however, that each figure it uses must be examined with care. The record shows that they are false. The district court found that many of the government's statistical combinations "have no sound statistical basis and are predicated on implausible hypotheses not supported by evidence." (App. 48a). The government does not contest this finding; it tries to ignore it.

It is never easy to demonstrate the falsity of statistics, but the record in this case is such as to permit it to be done.

In the first place, the metal can and glass container industries are so different that they do not use a common system of statistical notation. The can industry reports to the Census Bureau in terms of the amount of tinplate consumed; the glass industry in terms of units, by end

use categories, shipped. At the trial the government witness presenting its statistics testified that he had never heard of combined figures (Tr. 2941). He had set about to make his own combinations.[12]

In an attempt to convert the tinplate use to units of metal cans, the government took a series of figures from the can industry's trade association which were clearly marked as the hypothetical number of cans which could have been made from the amount of tinplate consumed. These figures were never used by the trade association without being clearly marked as hypothetical. They were admittedly made without regard to product mix, which the record shows varies greatly from company to company, and by making certain undisclosed assumptions with respect to size of cans and weight of tinplate used in making metal cans (Tr. 2931-38, GX 800).

From the trade association's hypothetical figure the government computed an assumed conversion factor (one never used by the trade association—Tr. 2989) which it applied to the Census Bureau figures of total tinplate consumed in the making of cans of all sizes and shapes. No attempt was made to allow for variations in sizes of cans, which obviously vary widely.

Using the method described, with its clearly erroneous assumptions, the government then had a figure which it called the total number of units of cans manufactured. To this it added the total number of units of glass containers shipped, counting each unit as one although the record shows that great numbers of the glass containers were returnable bottles used on an average of twenty-two times each (Tr. 2363). The Census Bureau has, for obvious reasons, always carefully separated returnable from non-returnable bottles (Tr. 2944). The largest category of

[12] He was not a qualified statistician (Tr. 2849-51).

returnable bottles is beer bottles. Since Hazel-Atlas' production of beer bottles was negligible, the distortion was extremely large.

To this artificially constructed universe figure the government applied Continental's usage of tinplate, similarly converted into hypothetical units, and Hazel-Atlas' production of units of glass containers, to get a percentage of the total. This percentage was carried out beyond the decimal point to give an appearance of exactitude.

The percentage figures have no relationship to reality. They are false.

At the trial the government attempted to construct figures showing Continental's and Hazel-Atlas' share of containers used in "food canning." It now recognizes that it failed in this (J. S. 23), but it proposes a totally unfounded assumption that the proportion would be the same as the proportion of the whole. Even if the stated proportion of the whole were reliable, which it clearly is not,[13] this assumption would be untenable for the product mix of each of the two companies was entirely different from the rest of their respective industries.

Finally, the government, recognizing the weakness of its statistics, says that in any event they can be relied upon for "the accuracy of the broad picture presented" (J. S. 23). They cannot be relied on for any picture, broad or narrow, because they are based on inherently unsupportable assumptions.

In any event, the district court admitted these statistics in evidence, accorded them every possible weight, and properly concluded that there was no showing, statistical or otherwise, of the forbidden anti-competitive effects in any line of commerce.

---

[13] To get this proportion, the government relies on the pseudo "GX 636" (J. S. 23).

Conclusion.

In an extremely conscientious examination of the law and the facts the district court found that there had been a failure to prove any violation of Section 7. The appeal presents no questions of law for this Court's review. The government would have this Court examine *de novo* a large record compiled in a lengthy pre-trial and trial, and make new findings in place of those made by the trier of facts, who spent large amounts of time over a period of several years in their preparation. Under Rule 52(a) those findings cannot be set aside unless they are clearly erroneous. No such showing has even been attempted, much less made, here. This is a fact case pure and simple. The appeal should be dismissed for the reasons stated above or the judgment of the district court should be affirmed without further briefs or oral argument.

September 11, 1963

Appellee's Appendix 1.

(Exhibit DX-N)

Ammonia	All or substantially all in glass.
Antiseptics	All or substantially all in glass in consumer size.
Baby Foods	80% glass; 20% cans.
Beer and ale	39% cans; 6½% non-returnable glass; balance returnable glass.
Brilliantines	All or substantially all in glass in liquid form and some collapsible tubes with different formulation.
Catsup	All or substantially all in glass in consumer size—Institutional all or substantially all in cans—plastic film or containers for individual servings—very small.
Cheese spreads	90% glass; balance aluminum tumblers, plastic tubes and film, collapsible metal tubes, foil, crocks and paper; no cans.
Chili sauce	All or substantially all in glass.
Cider	All or substantially all in glass.
Citrus segments, chilled	All or substantially all in glass.
Citrus segments, non-refrigerated	95-100% cans.
Coffee, ground	Less than 1% in glass; balance in cans and paper bags.
Coffee, soluble	99% glass; 1% cans.
Cologne	95-100% glass — some aerosols of glass, metal and plastic.
Corn	All or substantially all in cans.
Corned beef hash	95% cans.
Cosmetic creams	90% glass; 5% plastic; 5% collapsible tubes.
Crabmeat	All or substantially all in cans.
Cranberry sauce	All or substantially all in cans.
Cream, whole	50% glass; 50% paper—no cans.

Cured ham	All or substantially all in cans.
Distilled spirits	All or substantially all in glass.
Drugs, ethical in liquid form	All or substantially all in glass.
Flavoring extracts	All or substantially all in glass.
Food sauces other than tomato sauce	All or substantially all in glass.
Fruit spreads and preserves	More than 95% in glass for home consumption.
Green beans	95% cans; 5% glass.
Hair lacquer	All or substantially all in metal.
Hair tonic	More than 95% in glass.
Hominy	All or substantially all in cans.
Horse radish	All or substantially all in glass.
Juices, concentrated and frozen	All or substantially all in cans.
Lard	All or substantially all in cans; a little paper.
Lighter fluid	90% cans—10% glass.
Lima beans	All or substantially all in cans.
Liquid bleach	All or substantially all in glass.
Liquid shoe polish	All or substantially all in glass.
Lubricating grease	All or substantially all in cans.
Luncheon meat	All or substantially all in cans.
Machine oil	Substantially all in cans.
Marachino cherries	All or substantially all in glass in consumer size.
Mayonnaise	All or substantially all in glass in consumer size.
Milk, whole	55% paper—45% glass.
Mineral oil	All or substantially all in glass.
Motor oil	All or substantially all in cans.
Mouth wash	All or substantially all in glass.
Mustard, prepared (consumer size)	95% glass—5% plastics.

[illegible]sh	All or substantially all in glass.
Nail polish remover	All or substantially all in glass.
Olives, green	All or substantially all in glass.
Olives, ripe	90-95% cans; balance glass.
Paint, oil base (household, interior and exterior)	None in glass.
Paint, polyvinyl acetate base (household, interior and exterior)	None in glass.
Paint, rubber base (household, interior and exterior)	None in glass.
Paste shoe polish	All or substantially all in cans.
Peaches	95% cans—5% glass.
Peanut butter (consumer size)	90% glass—5% plastic and 5% cans.
Pears	95% cans—5% glass.
Peas	All or substantially all in cans.
Perfume	All or substantially all in glass.
Pickles	Over 95% glass for household use—balance between cans and plastic film.
Pineapple	All or substantially all in cans.
Proprietary medicine in liquid form	95% glass—5% plastics.
Prune juice	All or substantially all in glass.
Pumpkin	All or substantially all in cans.
Relish (consumer size)	All or substantially all in glass.
Salad and cooking oils (consumer size)	85% glass; 15% cans.
Salad dressings	100% glass for retail.
Salmon	All or substantially all in cans.
Sardines	All or substantially all in cans.
Single strength blended orange and grapefruit juice	Over 95% cans.
Single strength grape fruit juice	90-95% cans; balance glass.

Soft drinks	98½% glass; balance cans (1% is one way bottle).
Solid and semi-solid shortening	All or substantially all in cans.
Soup (Liquid form)	All or substantially all in cans.
Squash	All or substantially all in cans.
Starch (Liquid form)	All or substantially all in glass.
Sweet Potatoes	All or substantially all in cans.
Syrup, chocolate	95% cans—5% glass.
Toilet water	All or substantially all in glass.
Tomato juice	Over 95% in cans.
Tomato paste	All or substantially all in cans.
Tomato puree	All or substantially all in cans.
Tomato sauce	All or substantially all in cans.
Tomatoes, stewed	All or substantially all in cans.
Tomatoes, whole	All or substantially all in cans.
Tuna fish	All or substantially all in cans.
Vinegar	All or substantially all in glass consumer size.
Wax beans	Over 95% cans—balance glass.
Wet pack pet foods	90-95% cans; balance glass.
Wine	All or substantially all in glass.
Writing ink	All or substantially all in glass except refill cartridges.

Appellee's Appendix 2.

(Stipulation—Tr. 2697-2701).

The plaintiff stipulates that if the remaining FBI witnesses which it will call to testify were cross-examined with respect to the following matters each of them would answer substantially as follows:

That he had never been employed by a can manufacturer, a glass container manufacturer, a plastic container manufacturer or a firm engaged in conducting surveys or polls of public opinions or consumer preference, and that he is not experienced in the techniques of such polls or surveys;

That he has never been employed by a packer who uses any of the kinds of containers that he observed during the course of his assignment;

That he has not been in communication with any of the packers whose products he has stated that he observed;

That he is not a chemist;

That he does not know the difference between high-density and low-density polyethylene, nor the difference between either of them and polystyrene;

That he took no note of and made no list of products in the stores which he visited which were packed in only one type of container;

That he took no note of and made no record of prices of the products which he observed;

That he took no note of and made no record of the quantities of products in the containers he observed;

That he took no note of and made no record of the quality of the products in the containers he observed;

That he took no note of and made no record of the differences in the preparation of the products in the containers he observed;

That he could not say whether the products which he observed were specially packed for special purposes, such as, for example, dietetic purposes;

That he did not know whether any of the products which he observed were processed by heat sterilization;

That he made no observation as to the amount of shelf space devoted to the different types of containers used to package what he considered to be similar products;

That he has no information as to the quantities of any of the products which he observed in inventory in any store, or as to the quantities sold in any store in any period of time, or as to the quantities sold in the metropolitan area of the community in which the observations were made, or as to the quantities sold in the United States at any time;

That he has no information with respect to the formulation of any of the products which he observed to be packaged in cans or glass or plastic;

That he did not notice whether any of the products which he observed were packaged locally or at a distance;

That he could not tell from the package of any article which he observed whether or not it was being test-marketed, or whether or not it was obsolete stock, or whether or not it had been packed as an experiment, or whether or not it was on special sale on the date of the observation;

That he couldn't tell from the package of any article which he observed whether or not the packager who packaged it is still packing in the same type of container;

That he could not tell from the package of the products that he observed or from any other source why the packer chose the particular type of package for the product;

That in the case of stores whose principal business is the sale of foods, he noticed that they carried fresh fruits and vegetables, fresh meats and fresh dairy products, that they carried frozen foods and foods in dried or dehydrated forms, but that he made no particular observations as to what the particular products were;

That he has no information as to the method of processing the various products he observed and no information as to the method of filling the containers he observed.

In the Supreme Court of the United States

OCTOBER TERM, 1963

No. 367

UNITED STATES OF AMERICA, APPELLANT

v.

CONTINENTAL CAN COMPANY AND HAZEL-ATLAS GLASS COMPANY

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE SOUTHERN DISTRICT OF NEW YORK

BRIEF IN OPPOSITION TO MOTIONS TO DISMISS OR AFFIRM

The Solicitor General acknowledges, and greatly regrets, his error in citing, in the jurisdictional statement, a number of supposed "exhibits" that were in fact never admitted. The mistake has no bearing whatever on the merits of the present case, but unfortunately it raises doubt as to the uniform reliability of the government's court papers. Because of our awareness of the general importance of maintaining that standard, this reply will first describe the specific measures being taken to avoid repetition of the error. Next, we will show that the errors do not affect the substance of the issues in this case, because the facts that the documents were cited to demon-

707-741—63

strate were amply proved by evidence as to which there can be no contest. Finally, we deal briefly with appellee's argument on the merits of the appeal.

I

The government's citation of exhibits which had been marked for identification but not introduced in evidence was the cumulative result of several circumstances. The jurisdictional statement was prepared by attorneys in the appellate section of the Antitrust Division and in the two and a half year interval since the trial had ended, the recollection of the trial staff had become dimmed and the working records which it had maintained during the trial were not adequately studied. Under the practice of the District Court for the Southern District of New York, the exhibits were not part of the physical record, but in this case were returned to the government by the court. The clerk of the district court did not maintain a list or a set of the exhibits which had been admitted in evidence, and the certified record which he transmitted to this Court did not contain either the exhibits themselves or an index to them. Furthermore, the court reporter did not include a table of exhibits in the index to the transcript.

All the exhibits which had been marked for identification at the pre-trial proceedings were bound, consecutively numbered, in several volumes. The attorneys handling the appeal mistakenly assumed that all the documents so bound had been received in evidence.

The error could have been avoided by checking the transcript to find the point at which each exhibit was

admitted. Accordingly, in order to avoid any possible repetition of the error, the government henceforth will cite in its jurisdictional statements the page of the transcript at which each document cited was received in evidence, thus applying the rule applicable to briefs upon a printed record (Rule 40(2)). This procedure should prevent inadvertent reliance upon any documents that were not received in evidence.

II

The mistaken citation of exhibits which had been marked for identification but not received in evidence, has no bearing upon the merits of the case because all of the material facts in our jurisdictional statement are fully supported by other documents which were admitted into evidence.

(a) GX 636, which we did not offer in evidence, is a 1956 publication of Continental intended to promote the use of cans for food. It was mistakenly cited on pages 14, 15–16 and 23 of our Jurisdictional Statement to support the statements that "the 'annual production of the canning industry amounts to more than 20 billion pounds, representing about 8½ percent of the Nation's food supply' and that containers for hermetically-sealed, heat-sterilized food are 'packed in almost 700 million cases or about 20 billion tin and glass containers' "; and that the food canning industry consumes an estimated 35 percent of all metal and glass containers.[1] GX 656, a similar

[1] The percentage was computed by comparing Continental's figure in GX 636 of 20 billion metal and glass containers used in food canning with the total shipments of metal and glass containers in the continental United States (GX 801, table 3a).

1958 publication of Continental, admitted into evidence at Tr. 3569, states substantially the same facts for 1958 as follows:

> The annual production of the canning industry now amounts to more than 22 billion pounds, representing about 8½% of the nation's food supply. This is packed in 700 million cases containing more than 22 billion tin and glass containers.

The 8½ percent and 700 million case figures in the two exhibits are identical. The estimated percentage figure, if based on the admitted exhibit, GX 656, instead of upon the unoffered GX 636, would still have been about 35 percent.

(b) The government introduced in evidence a large number of documents showing that there was active competition between manufacturers of metal and of glass containers in selling and attempting to sell containers to packagers of numerous food items. At page 18 of the jurisdictional statement we mistakenly cited GX 415A, 418, and 421, which had not been offered in evidence. GX 415A and 418 are studies and surveys of the baby food container market prepared for Continental, which reveal that company's interest in increasing its share of that market at the expense of glass containers. GX 421 was an internal memorandum of Continental indicating its interest in entering the field of wine packaging, dominated by glass containers.[2]

[2] GX 421, although not offered in evidence by the government (Tr. 3559–3560), was marked by the court clerk as in evidence (see notation on the original exhibit).

The same active competition by glass and metal container manufacturers, and the attempts of each to sell to packers using the competing containers, are demonstrated by similar documents in evidence which are cited on page 18 of the jurisdictional statement. The baby food market is explored at length in GX 415B, 416, 419, 419A, 419B, 419C, 420.[a] While there is no document in evidence specifically dealing with wine, there are documents in evidence which show Continental's similar interest in packaging tomato catsup, barbecue sauce, chocolate syrup, salad dressings and whipped toppings, referred to on page 18 of the jurisdictional statement. The significant fact is that Continental endeavored to sell metal containers to food packers who were using glass, and the significance of such endeavors is not vitiated by deletion of the reference to wine on page 18.

(c) GX 774 (not offered in evidence) is a letter from the Vice President and General Sales Manager of Hazel-Atlas to one of that company's sales representatives, comparing the prices of its glass containers with competing metal containers. It was mistakenly cited on page 19 of the jurisdictional statement in a paragraph emphasizing the cross-elasticity of demand between glass and metal food containers, and the awareness of the manufacturers of such containers that food processors were prepared to change from one type to another if there was a significant price differential. The same information is provided by

[a] These exhibits were admitted, respectively, at Tr. 2006, 3556, 3558, 1417, 1417, 1417, 3559.

GX 773, 775 and 776, admitted in evidence[4] and cited in the same paragraph; two of them are quoted in footnote 14, page 19. These three documents show that customers of Hazel-Atlas threatened to package their products in metal containers if glass container prices were substantially raised.

(d) The 26 documents cited on page 7 of the appellee's motion (GX 4–1. 15, 17–23, 25–30, 32, 41) which were not offered in e idence, were records of the Glass Container Manufacturers' Institute (GCMI). They were mistakenly cited as examples of the glass-container trade association's efforts to induce the replacement of metal containers with glass. At that point, we were demonstrating that the inter-industry competition found by the court below (J.S. 35a–36a), of which Continental and Hazel-Atlas were a substantial segment, was reflected in the activities of their respective trade associations. The same activity by the glass container association is clearly demonstrated in the similar GCMI exhibits in evidence which are cited on page 19 (GX 1–3; GX 14; GX 24; GX 31; GX 33–40; GX 42–131; GX 304; GX 319–346).[5]

---

[4] These exhibits were admitted, respectively, at Tr. 1549, 1559, and 2122.

[5] These exhibits were admitted in evidence as follows: GX 1–3, Tr. 2329–2330; GX 14, Tr. 2333; GX 16, Tr. 2334; GX 24, Tr. 2334; GX 31, Tr. 2335; GX 33–40, Tr. 2098; GX 42, Tr. 2139; GX 43–55, Tr. 2146; GX 56, Tr. 2151; GX 57, Tr. 2152; GX 58–61, Tr. 2153; GX 62–64, Tr. 2154; GX 65–71, Tr. 2157; GX 72, 73, Tr. 2158; GX 74, Tr. 2159; GX 75, Tr. 2160; GX 76, Tr. 2163; GX 77, Tr. 2164; GX 79, Tr. 2166; GX 80, Tr. 2167; GX 81, 82, Tr. 2168; GX 83, Tr. 2169; GX 84, Tr. 2169; GX 85–131, Tr. 2127; GX 304, Tr. 3586; GX 319–346, Tr. 2110. Although government records indicate that GX 78 was admitted,

(e) GX 414, mistakenly cited at page 17 of the jurisdictional statement, was a proposal by Continental's advertising agency for the introduction of metal containers for soluble coffee. It was offered at the trial, objected to on various grounds and excluded by the district court as cumulative (Tr. 3553–3554). It was cited as one of a list of eleven exhibits relating to the use of metal containers for soluble coffee. Nine of these exhibits, all of which are in evidence (GX 405, 405A, 406, 407, 408, 409, 411, 412, 413)[6] show that Continental did in fact attempt to induce such food processors to convert from glass to metal containers.

The foregoing comparison of the mistakenly cited exhibits with those in evidence clearly demonstrates that our jurisdictional statement presented a fair statement of the "facts material to the consideration of the questions presented" which were supported by the record, as Rule 15(d) requires. The motion to dismiss should be denied.

---

as does the clerk's notation on the original document, and appellee has not contended to the contrary, we are unable to find a reference to this exhibit in the transcript.

[6] These exhibits were admitted in evidence as follows: GX 405 (in part), Tr. 1775; GX 405A, Tr. 520, 614; GX 406, Tr. 3547; GX 407, Tr. 3549; GX 408, Tr. 1777; GX 409, Tr. 1778; GX 411, Tr. 3550; GX 412, 413, Tr. 3553.

The first quotation in footnote 13, page 17 of the Jurisdictional Statement, was mistakenly taken from a part of GX 405, which was not admitted (Tr. 1772). GX 410 was also not admitted into evidence (Tr. 1779), but is identical, except for the name of the person to whom it was sent, with GX 409, which is in evidence (Tr. 1778). These errors were not pointed out by appellee.

III

The motion to affirm rests on a basic misconception of the nature of competition between corporations like Continental and Hazel-Atlas—very large firms in vigorous competition with each other, manufacturing and selling physically different products which are equally adaptable to the needs of a vast number and variety of end users. The antitrust laws express a concern with broader forms of competition than the activities of rival salesmen currently selling the same or similar products. The antitrust laws are equally concerned with maintaining the competition of rival technologies offering, or able to offer, suitable products in the market-place as alternative choices for a substantial body of customers. The adaptability of products like the containers of Continental and Hazel-Atlas to a wide variety of consumer needs means that the independent existence of such concerns is often as beneficial to consumers as if completed products were being sold, because of the continuous pressure not only to increase the use of one type of product at the expense of the other but also to develop new uses.

The failure to appreciate the importance of these forms of competition was the source of the district court's error. Its conclusion that this was "basically * * * a conglomerate combination" rather than a "horizontal combination" between competitors (J.S. App. 38a–39a), notwithstanding its finding of "substantial and vigorous" competition between glass and metal container manufacturers (including Hazel-Atlas and Continental), reflects the mistaken view that the Clayton Act is less concerned with "inter-

industry" competition of the kind described than with simpler phenomena. Several of appellee's contentions reflect the same misconception. For example, it is asserted that our interindustry line of commerce is vitiated by the fact that the glass and metal container companies are in separate recognized industries, that the two types of containers have distinct physical characteristics, and that they are made of different raw materials by means of different manufacturing equipment and processes (Motion, pp. 13, 15–16). These facts show only that glass and metal containers are physically distinct products. They do not touch upon the issue in this case, which is whether, because of the competition between the manufacturers of such products, they form an appropriate single line of commerce within which the anticompetitive consequences of the merger may be evaluated.

Appellee urges (Motion, p. 9) that the case does not present the question whether statistical evidence of market shares in a defined product market must be proved by the government under the Clayton Act. This issue is posed because the district court, although finding that there is "substantial and vigorous" competition between Continental and Hazel-Atlas, was unable to measure this competition in percentage terms which expressed its substantiality. Admittedly, the interindustry nature of the competition makes it difficult to develop the customary market share statistics. We believe, however, that there was ample evidence to show the substantiality of the competition being eliminated between the companies and

that the court erroneously failed to appreciate this. See our jurisdictional statement, pp. 12–14, 20–25.

Finally, appellee attacks at great length (Motion, pp. 9–26) our analysis of perhaps the most significant market in which Continental and Hazel-Atlas compete—the manufacture and sale of containers for food-canning. To refute our proof that food canners consider and use metal and glass containers as reasonably interchangeable, appellee chiefly relies upon evidence that numerous commodities, at a particular time, were distributed predominantly in one type of container rather than in the other. Its primary reliance is upon DX–N, in which a government witness gave his estimates of the extent to which 92 specific commodities (out of 129 suggested by appellees), about 60 of which were food, were packaged in glass and in metal.[7] But in a field where the court found that there are "literally thousands of packers purchasing containers for packaging hundreds of food products" (J.S. App. 81a), such a limited predominance is not persuasive. In any event, analysis of the competition between Continental and Hazel-Atlas must start with the fact that metal and glass containers are adaptable to almost any food use.

[7] DX–N and DX–O were admitted in evidence at Tr. 2107. DX–O was a list of 129 food and non-food products made up by counsel for appellee (Tr. 2103). From this exhibit, the government witness, Cheney, chose 92 products with respect to which he stated that he could give an opinion, with reasonable certainty, based on his recollection (Tr. 2350), of the relative amounts of each which were packed in glass and metal containers. The list of the 92 commodities and his estimates constitute DX–N.

While at any specific time a particular commodity may be sold largely in one type of container, the record shows that the manufacturers of the other type of container continuously attempt to increase their share of the packaging of such products, are ever alert to opportunities to replace the competing container, and, in fact, employ price pressure, innovation of product and extensive advertising in order to do so. In short, this interindustry competition usually takes the form of a manufacturer of one type of container trying to take customers away from manufacturers of the other type. Such activities constitute the actual and potential competition which always exists between metal and glass containers and which was going on between Continental and Hazel-Atlas prior to the acquisition. The existence of that form of competition is not negated by showing that the use of glass or cans was the prevailing practice during particular periods. In the jurisdictional statement, pp. 14–20, we set out in summary form the record basis for our conclusion that the amount of competition in the food canning line, eliminated by the merger, was substantial.

The simple, ultimate question in this case is whether two giant corporations in different industries, each plainly able and ready to meet the needs of many of the same buyers, may combine without violating Section 7 of the Clayton Act.

Probable jurisdiction should be noted.

Respectfully submitted.

In the Supreme Court of the United States

OCTOBER TERM, 1963

No. 367

UNITED STATES OF AMERICA, APPELLANT

v.

CONTINENTAL CAN COMPANY AND HAZEL-ATLAS GLASS COMPANY

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE SOUTHERN DISTRICT OF NEW YORK

BRIEF FOR THE UNITED STATES

OPINION BELOW

The opinion of the district court, comprising its findings of fact and conclusions of law (R. 1574–1654), is reported at 217 F. Supp. 761.

JURISDICTION

The judgment of the district court was entered on April 16, 1963 (R. 1654),[1] and the notice of appeal was filed by the United States on June 14, 1963 (R. 1655). This Court noted probable jurisdiction on

[1] "R." refers to the record printed in this Court. "GX" refers to the government's exhibits, and "DX", to defendants' exhibits. In the appendix, pp. 55–58, *infra*, we list the places in the record at which each cited exhibit was admitted in evidence.

October 28, 1963 (R. 1656; 375 U.S. 893). The jurisdiction of this Court is conferred by Section 2 of the Expediting Act of February 11, 1903, 32 Stat. 823, as amended, 15 U.S.C. 29.

QUESTIONS PRESENTED

The main question is whether the evidence presented by the government established that a merger eliminating substantial competition between Continental Can Co., the second largest metal container maker, and Hazel-Atlas Glass Co., the third largest glass container maker, violates Section 7 of the Clayton Act. Subsidiary questions are:

1. Whether the government's proof that this merger eliminated substantial competition in the entire range of uses for which glass and metal containers compete and that each of the merging companies had a dominant position in a highly concentrated industry was sufficient to render the merger illegal under Section 7 of the Clayton Act.

2. Whether the elimination of competition between the merging firms and the increased concentration in the production of containers for food canning made the merger illegal under Section 7 of the Clayton Act.

STATUTE INVOLVED

Section 7 of the Clayton Act, 38 Stat. 731, as amended, 64 Stat. 1125, 15 U.S.C. 18, provides in pertinent part:

> No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no corporation subject to the jurisdiction of the

> Federal Trade Commission shall acquire the whole or any part of the assets of another corporation engaged also in commerce, where in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly.

STATEMENT

This is a civil action brought by the United States challenging, under Section 7 of the Clayton Act, the acquisition by Continental Can Company, Inc. ("Continental") of Hazel-Atlas Glass Company ("Hazel-Atlas").

Prior to instituting this action, the United States, on learning of Continental's plans to acquire Hazel-Atlas, sought to prevent the proposed merger under a 1950 consent judgment, which had been entered in a suit charging price-fixing and lease tie-in arrangements and which barred Continental from acquiring any "container" manufacturers.[2] In August 1956, the United States District Court for the Northern District of California, finding that the term "container" as used in the judgment did not encompass glass containers, held that the consent decree did not cover the proposed acquisition.[3]

The United States thereupon commenced this action on September 10, 1956, moved for a preliminary injunction, and sought a temporary restraining order

---

[2] *United States* v. *Hartford-Empire Co.*, 46 F. Supp. 541 (N.D. Ohio), affirmed in part, reversed in part, 323 U.S. 386.

[3] *United States* v. *Continental Can Co.*, 143 F. Supp. 787 (N.D. Cal.) (R. 1575).

pending the hearing and determination of that motion. The motion for a temporary restraining order was denied on September 13, 1956, the district court stating that "should the acquisition be ultimately held violative of the Clayton Act, plaintiff's relief may be accomplished by a decree of divestiture".* On that day, Continental acquired all of the assets, properties, business, and good will of Hazel-Atlas in exchange for 999,140 shares of Continental common stock and the assumption by Continental of all the liabilities of Hazel-Atlas (R. 13).

After extensive discovery proceedings by both parties, trial began in June 1960 (R. 14). At the conclusion of the government's case, on October 19, 1960, defendants moved to dismiss the complaint (R. 1564). On December 8, 1960, the district court, in a brief oral statement, indicated that it had decided to grant the motion and that its written findings and opinion, as well as the judgment, would follow (R. 1565–1574). No opinion or findings were rendered before June 25, 1962, when this Court announced its decision in *Brown Shoe Company* v. *United States*, 370 U.S. 294. The government thereupon requested the district court to reconsider its oral opinion in light of the *Brown Shoe* decision (R. 1576).

On April 16, 1963, the district court issued its written opinion incorporating findings of fact and conclusions of law, and granting defendants' motion for judgment (R. 1574–1654).

---

* Memorandum Order, September 13, 1956.

1. THE MERGING COMPANIES

(a) Continental, a New York corporation, was organized in 1913 to acquire all the assets of three metal container manufacturers (GX 786; R. 2837). By 1921, Continental was the second largest manufacturer of metal containers in the United States (exceeded only by American Can Company) and was several times larger than the third-ranking firm, United States Can Company. Soon thereafter, Continental commenced an extensive series of acquisitions. Between 1927 and 1929 it acquired 16 domestic companies, including the third-ranking United States Can Co.[5] More recent acquisitions have marked its further expansion. (GX 786; R. 2849–2863). Its latest acquired metal container firm was the Owens-Illinois Can Co., a subsidiary of Owens-Illinois Glass Co., which it purchased in 1944, thereby terminating the one serious attempt by a glass container firm to enter the metal container business (GX 785; R. 91, 100, 2831–2834, 2863). At the time this action was commenced, Continental had acquired a total of 21 domestic companies in the metal container field and a large number engaged in other aspects of packaging. This latter group includes seven producers of flexible packaging; one manufacturer of

[5] GX 786, R. 2839–2848; "Profits in Cans", *Fortune*, April 1934, p. 81. Although negotiations were also conducted regarding a merger with Owens-Illinois Glass Corporation, the largest glass container manufacturer, collapse of the stock market in 1929 aborted these plans. Hession, *Competition in the Metal Food Container Industry (1916–1946)* (1948), pp. 53–54.

polyethylene bottles and similar plastic containers; 14 producers of paper containers and paperboard, including fibre drums, folding boxes, and corrugated shipping containers; four (including Hazel-Atlas) making closures for glass containers; seven producing a miscellany of products; and one, Hazel-Atlas, producing glass containers.[6]

By 1955, prior to this merger, Continental had total assets of $382 million and operated 72 domestic plants, of which 30 had been obtained through acquisitions (GX 785, 786, 900, 1211; R. 2829–2863, 3049–3050, 3278). In that year, Continental shipped approximately 33 percent of all metal containers sold in the continental United States, and was the second largest company in the field. The leading producer, American Can Company, shipped 40 percent of the total. These two leading companies thereby ac-

[6] (GX 785, 786; R. 2829–2863) As stated in the leading work on the industry, Continental has "expanded tremendously through a series of mergers and outright purchases of other concerns," while American Can's growth, during the last 30 years, has been "largely internal". Hession, *Competition in the Metal Food Container Industry, 1916–1946* (1948), p. 51. Continental's acquisitions until 1946 are described at pp. 51-58 of this work. American Can's pre-1908 acquisitions had brought together a large portion of the industry in what was found to be an attempt to monopolize. *United States* v. *American Can Co.*, 230 Fed. 859 (D. Md. 1916), decree rendered, 234 Fed. 1019, appeal dismissed, 256 U.S. 706 (1921). Sources for the history and competitive conditions of the metal can industry are Hession, *supra;* Hession, "The Metal Container Industry" in Adams ed., *The Structure of American Industry* (3d ed. 1961), chap. 12; Whitney, *Antitrust Policies: American Experience in Twenty Industries* (1958), Vol. II, chap. 16; McKie, *Tin Cans and Tin Plate* (1959).

counted for approximately 73 percent of all metal containers. The third largest manufacturer, National Can Company, shipped about 5 percent. The remaining 24 percent of this market was shared by 75 to 90 other firms (R. 412–413, 1590; GX 801; R. 2962).

According to Continental, the acquisition of Hazel-Atlas was part of its program to develop a complete line of containers (GX 900, 1242; R. 3048–3049, 3293–3295, 3300–3306). A few weeks after its acquisition of Hazel-Atlas in September 1956, Continental acquired the Robert Gair Company, Inc., a leading manufacturer of paper and paperboard products (GX 1212; R. 3293–3296, 3302–3303).[7] Earlier in the same year, Continental had also acquired the White Cap Company, a leading producer of vacuum-type metal closures for glass food containers (GX 1211; R. 3267–3268, 3282).[8] At that time, Continental also contemplated entry into the beverage bottle field, which was to be facilitated by the acquisition of another glass

---

[7] Gair had net sales in 1955 of $160.2 million and assets of $134.9 million. It was "a leading producer of folding cartons, shipping containers, paperboard, and other paper products" (GX 1242; R. 3294. See R. 3302–3303). On October 30, 1956, the United States filed another complaint against Continental alleging that this acquisition violated Section 7 of the Clayton Act (R. 3231).

[8] White Cap shipped approximately 18.5 percent of all types of metal closures made from tin plate in that year (GX 803; R. 3030). As the district court noted, two years later, when such figures became available, it was determined that White Cap had accounted for approximately 60 percent of the production and shipment of all vacuum closures made from tin plate (GX 803; R. 3031).

container company specializing in that product (GX 788, 900; R. 2864, 3051). As a result of its three mergers in 1956, Continental's assets rose from $382 million to more than $633 million (GX 1212; R. 3317), and its net sales and operating revenues rose from $666 million to more than $1 billion (GX 1212; R. 3319). Measured by sales, it moved from the 47th (in 1955) to the 31st largest United States industrial corporation in 1956.[9]

(b) Hazel-Atlas, a West Virginia Company organized prior to 1900, was incorporated in 1901 as the Atlas Glass and Metal Company, and later merged with the Hazel Glass Company (*United States* v *Hartford-Empire Co.*, 46 F. Supp. 541, 547). It was one of the leaders in the mechanization of the glass container industry which was, at first, largely hand-operated. The development in 1903 of the automatic "suction" machine by the Owens Bottle Machine Company revolutionized the glass container industry, and Hazel-Atlas was granted an exclusive license to manufacture wide-mouth food jars by means of the Owens machine (R. 335–336). Thereafter, Hazel-Atlas entered into further licensing agreements under which it operated as the price leader for wide-mouth containers.[10] At the time of the *Hartford-Empire* case, Hazel-Atlas

[9] See *Fortune*, "Directory of the 500 Largest U.S. Industrial Corporations" (July 1956, July 1957).

[10] See *United States* v. *Hartford-Empire Co.*, 46 F. Supp. 541 (N.D. Ohio), affirmed in part and reversed in part, 323 U.S. 386. Glass containers are generally classified into narrow-neck (*e.g.*, for beverages and catsup) and wide-mouth containers (*e.g.*, for fruits and peanut butter) (R. 79). The latter are used predominantly for packing foods (R. 335).

was the second largest manufacturer of glass containers generally, and the largest maker of wide-mouth ware (46 F. Supp. at 613).

Prior to the merger with Continental, Hazel-Atlas, with net sales of more than $79 million, shipped approximately 9.6 percent of the glass containers in the continental United States, and was exceeded only by Owens-Illinois Glass Company (34.2 percent) and Anchor-Hocking Glass Company (11.6 percent) (GX 801, 1209; R. 2956, 3217). The remaining 44.6 percent of the market was divided among at least 39 other firms (R. 1593). Hazel-Atlas then had assets of $37 million, including 13 plants (GX 1210; R. 8, 11, 1584 3222, 3249–3250). It had always operated as a profitable venture and had not missed a dividend since 1907 (R. 337).[11]

2. THE DECISION OF THE DISTRICT COURT

In its opinion of April 15, 1963, the district court identified three classes of products produced by Continental and Hazel-Atlas which it considered to be relevant to a consideration of the legality of this merger (metal, glass and plastic containers),[12] and characterized each as being produced by a separate

[11] Prior to its acquisition in 1955, Hazel-Atlas had ranked as 347th of the 500 largest industrial corporations by sales, with sales of $79,174,000, and a net profit of more than $3 million. *Fortune*, "Directory of the 500 Largest Industrial Corporations for 1955," July 1956.

[12] For the purpose of this appeal, we accept the district court's rulings that closures (devices used to close and seal various containers) are not a relevant separate line of commerce (R. 1627), and that the relevant geographic market is the United States as a whole (R. 1600–1601).

industry (R. 1585, 1590-1597, 1603). The court found that "there was substantial and vigorous inter-industry competition between these three industries and between various of the products which they manufactured * * *. Each industry and each of the manufacturers within it were seeking to improve their products so that they would appeal to new customers or hold old ones. Hazel-Atlas and Continental were part of this overall industrial pattern, each in a recognized separate industry producing distinct products but engaged in inter-industry competition for the favor of various end users of their products" (R. 1603–1604).

The court ruled, however, that the existence of such "inter-industry or inter-product competition" did not mean "that the acquisition of Hazel-Atlas by Continental falls within the ambit of Section 7 of the Clayton Act" (R. 1604), and held that it was insufficient to make such "products from separate and distinct industries" constitute a line of commerce for the purposes of Section 7 (R. 1605). The court therefore held that this transaction could not be classified as a horizontal merger, since it was not between competing companies, and found it to be a "conglomerate" merger (R. 1606–1607) which "does not result in the elimination of a competitor but merely substitutes the competition of the acquiring company for that of the acquired company in the lines of commerce in which the acquired company was formerly engaged" (R. 1614).

Of the ten lines of commerce in which the government contended the merger would have anticompeti-

tive effects, the district court concluded that only three were supported by the evidence: the metal container industry (R. 1618–1622); the glass container industry (R. 1622–1627); and the production and sale of containers for beer (R. 1628–1633). In each of these, the court found inadequate evidence of probable anticompetitive effects resulting from this acquisition. The other proposed lines of commerce were rejected (R. 1633–1650). The court then held alternatively that "even assuming that any such product markets existed, * * * there was no proof of any reasonable probability of substantial anti-competitive effects or tendency to monoply as a result of the acquisition in any of them" (R. 1651).

SUMMARY OF ARGUMENT

I

This merger joins the second largest metal container manufacturer in the United States with the third largest glass container manufacturer. It combines dominant firms in two industries which have had a history of vigorous and unabated interindustry competition, and which have developed highly concentrated, oligopolistic, market structures. We submit that when a merger of such magnitude is involved, it is unnecessary for purposes of Section 7 of the Clayton Act for the government to demonstrate with precise statistical data exactly what share of the relevant product market will be affected by the merger, or what percentages had been held prior to the merger by either of the merging firms.

A. Section 7 protects interindustry competition as well as competition within an industry. This principle is particularly important in an age when modern technology and scientific advances have enabled manufacturers to cross traditional industry lines and compete in areas previously considered reserved to other industries. Competition between glass and metal container manufacturers has followed this pattern. Consequently, for "line of commerce" purposes, the present merger affects competition within the entire range of end uses for which metal and glass containers may now or hereafter be produced and sold.

B. The 1950 amendment to Section 7 was enacted principally to stem the tide of concentration in our modern economy. When, as is true here, a merger involves industries which are already highly concentrated, it is particularly suspect. And when the combining firms are each dominant in its own industry, the anticompetitive effect on interindustry rivalry is obvious. Accordingly, it should be sufficient for Section 7 purposes if the government proves: (1) substantial interindustry competition, (2) high concentration in either industry, and (3) the dominant positions of the merging firms. An interindustry merger on such a state of facts is sufficiently likely to have a substantial effect on present and potential competition between the industries to render it unlawful under Section 7. This "test of illegality" is, we submit, a more realistic measure of the consequences of such an interindustry merger than the selection and analysis of some relatively insignificant submarket in

which market shares can be demonstrated with accessible data.

C. The record in this case requires an affirmative finding on each of the three elements proposed above. Hence the government satisfied its burden of proof at the trial, and the district court erred in dismissing the complaint at the close of the government's case.

II

If it is necessary to engage in a market share analysis with respect to a merger of this magnitude, we submit that the record reflects a reasonable probability that the merger will substantially lessen competition in the production and sale of containers for "food canning"—*i.e.*, the process of hermetically sealing and heat-sterilizing food.

A. "Food canning" containers are a relevant product line for Section 7 purposes. Only metal and glass containers compete in this field, and they compete most vigorously. The record reflects substantial interindustry competition which is ultimately manifested in the choice available to consumers in retail grocery establishments. Many foods are "canned" in both metal and glass containers, and the merging firms in fact engaged in substantial competition *inter sese* for this market prior to their merger. In addition, the flexibility of manufacture enables most glass or metal container producers to manufacture containers for food "canning".

B. No precise authoritative statistics are available to determine market shares in this particular product market. However, the record contains figures, com-

piled from Bureau of Census data, showing market shares of the total metal and glass containers shipped in the United States and of those used for food of all kinds—whether or not hermetically sealed and heat-sterilized. In the absence of evidence to the contrary, these statistics may be assumed to provide a fairly accurate picture of the shares of the various leading firms in each significant component of the total food container market, including food "canning." On the basis of these figures, it is clear that the merger results not only in a significant increase in Continental's market share but also strengthens the undue concentration of power held by the three dominant firms in the relevant market. Therefore, under the standards announced by this Court in *Brown Shoe Co.* v. *United States*, 370 U.S. 294, and *United States* v. *Philadelphia National Bank*, 374 U.S. 321, this merger violated Section 7 of the Clayton Act.

ARGUMENT

I

THIS MERGER VIOLATED SECTION 7 OF THE CLAYTON ACT BECAUSE ITS PROBABLE EFFECT WAS SUBSTANTIALLY TO LESSEN COMPETITION IN THE PRODUCTION AND SALE OF CONTAINERS FOR ALL END USES FOR WHICH METAL AND GLASS CONTAINERS COMPETE

A. SECTION 7 APPLIES TO MERGERS WHICH WOULD SUBSTANTIALLY LESSEN INTERINDUSTRY COMPETITION

The terms of Section 7 of the Clayton Act bring within its prohibitory scope any merger which may substantially lessen competition "in any line of commerce in any section of the country." As this Court observed in *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 320–321, this language was chosen by Congress to

leave to the flexibility of the decisional process the test for measuring the relevant product and geographic markets. Under the statutory formula it is the duty of courts "to recognize competition where, in fact, competition exists," *id.* at 326, and to draw the market lines accordingly. In each instance the touchstone is "the area of effective competition" (*Standard Oil Co.* v. *United States*, 337 U.S. 293, 299 n. 5, quoted in *United States* v. *E. I. Dupont de Nemours & Co.*, 353 U.S. 586, 593)—a standard which is applied not by segregating industries but by "discovering patterns of trade which are followed in practice." *United States* v. *United Shoe Machinery Corp.*, 110 F. Supp. 295, 303 (D. Mass.), affirmed, 347 U.S. 521.

When, as in the present case, "patterns of trade" demonstrate vigorous competition between members of two separate industries for the business provided by a large number of consumers (pp. 25-33, *infra*), any elimination or substantial lessening of such competition must come within the reach of Section 7 if the legislative objective of the statute is to be accomplished. The words "any line of commerce" cannot, consistently with the policy underlying Section 7, be construed as words of limitation which render the statute applicable only to mergers having a substantial anticompetitive effect within one industry. Such an interpretation of the statute would cripple its application in all cases involving interindustry mergers and would place beyond the reach of Section 7 combinations which endanger the vitality of competi-

tion among separate industries—an increasingly important and pervasive element in our modern economy.

Business [13] and academic [14] observers have recently had occasion to emphasize technological strides which have enabled firms to enter fields traditionally regarded as the province of another industry, a practice which promotes competition by broadening the consumers' latitude of choice. The president of du Pont, for example, recently described how a new resin was being used to make pipe and other items previously reserved to steel, aluminum or other metals. (See note 13, *supra*). An enlightening earlier example is provided in the work by David Lilienthal which was cited in support of the concept of interindustry competition in *United States* v. *E. I. du Pont de Nemours & Co.*, 351 U.S. 377, 393 (the *Cellophane* case). The author there related how, in the mid-1930's, the Tennessee Valley Authority had been able to turn to the aluminum industry and obtain aluminum conductor

[13] *E.g.*, Lilienthal, *Big Business: A New Era* (1952), pp. 58–67; Greenewalt, *A Businessman Looks at the Antitrust Laws*, 23 A.B.A. Antitrust Section 337; *Wall Street Journal*, editorials February 11, 1964, p. 18, December 26, 1963, p. 4. These business comments were made in part to urge the inaptness of applying the monopoly tests of the Sherman Act within separate industries. Regardless of the correctness of this argument, see pp. 36–38, *infra*, the vigor and scope of modern interindustry competition is highly relevant to appraising the validity of interindustry mergers.

[14] *E.g.*, Clark, *Towards a Concept of Workable Competition*, 30 Am. Econ. Rev. 241; Hale & Hale, *Market Power: Size and Shape under the Sherman Act* (1958), pp. 105–113; Robertson, *On the Changing Apparatus of Competition*, 44 Am. Econ. Rev. 51.

cable for overhead transmission lines at a time when all the copper companies had uniformly offered identical and excessive bids.[15]

These illustrations represent the trend whereby modern research and technological advances have prompted the crossing of the "orthodox industrial boundaries"[16] separating industries which had long settled into oligopolistic structure and patterns of behavior. Conventional industry or commodity categories are of little value in ascertaining the vigor of competition in such situations.[17] Nor is the usual statistical analysis of market shares within an industry useful in measuring the precise ranking of large interindustry competitors.

As this Court observed in *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 317, the legislative history of the 1950 amendments to Section 7 clearly demonstrates that Congress intended to prohibit "not only * * * mergers between actual competitors, but also * * * vertical and conglomerate mergers whose effect may tend to lessen competition in any line of commerce in any section of the country."

We contend that this is such a merger and that the

[17] Hale & Hale, note 14, *supra*, at p. 112.

district court erred in concluding that this is merely a "conglomerate" merger which "does not result in the elimination of a competitor but merely substitutes the competition of the acquiring company for that of the acquired company" (R. 1606-1607, 1614). In fact, the district court's own findings as well as other evidence in the record (pp. 25–33, *infra*) demonstrate that there was substantial actual and potential competition between the acquired firm and the acquiring firm. If a line of commerce embraces more than one industry, the substantiality of the resulting competitive effects may be more difficult to measure statistically but they are nonetheless significant. And the appropriate "line of commerce" in such an instance is the broad over-all market comprising all end uses common to the products of the merging companies. In the present case, therefore, the "line of commerce" within which the merger's effect on competition should be appraised is the production and sale of containers used for all purposes for which metal or glass containers may be used—*i.e.*, beer, soft drinks, food canning, toiletries and cosmetics, medicines, and other household or chemical goods.[18]

[18] This overall line of commerce includes competition for the same end uses by other containers, such as paper, plastic and foil. The further competition of such other industries prevents expression in market share percentages of the impact of this merger. In our view, as shall be shown below, the great volume of metal and glass container competition enables the government to meet its burden of proving substantial anticompetitive impact by evidence relating to the metal and glass container industries alone.

B. THE MERGER OF DOMINANT FIRMS IN COMPETING INDUSTRIES EACH OF WHICH IS HIGHLY CONCENTRATED VIOLATES SECTION 7

Any appraisal of the validity of an interindustry merger such as this one must begin with what this Court has determined to be "the dominant theme pervading congressional consideration of the 1950 amendments" to Section 7—*i.e.*, "a fear of what was considered to be a rising tide of economic concentration in the American economy." *United States* v. *Philadelphia National Bank*, 374 U.S. 321, 362–363; *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 315. The legislative judgment "at the core of Section 7," the Federal Trade Commission recently observed, is that there is a "relationship between concentration (and related market-structure characteristics) and lessened competition." *In re Procter & Gamble Co.*, F.T.C. Docket No. 6901, p. 23 (November 26, 1963).

In industries which are fully competitive and where the degree of concentration is low, competition may be adequately preserved by the prevention of combinations within the single industry. But when, as is true of the metal and glass container industries, the competitive pattern discloses that each competing industry is dominated by a handful of firms, the primary purpose behind Section 7 requires recognition of the dangerous consequences which may flow from a merger between two firms which are dominant in the separate but competing industries.

In many concentrated industries, indeed, interindustry competition presents a real and pressing challenge to oligopolistic structure, and it is deserving of

Clayton Act protection as much as the possibility of "eventual deconcentration" by the growth of small firms within the industry to rival the few present-day leaders. High concentration not only makes collusive anticompetitive behavior more feasible, but also is likely to result in a tacit accommodation between the firms, less price competition, abandonment of other forms of rivalry and willingness to accept the leadership of the dominant firms and otherwise to conform to their competitive norms. *In re Procter & Gamble Co.*, F.T.C. Docket No. 6901, pp. 24–27 (November 26, 1963). The appearance of a substantial interindustry competitor on this scene introduces a new firm, with resources and staying power probably unavailable inside the industry, and without the history of mutual accommodation that may characterize those presently in the industry. Acquisition of such a firm by one of the industry leaders may be motivated by the latter's desire to protect itself against competition of substitute products,[19] and would have precisely such an

[19] Hale & Hale, *Market Power: Size and Shape under the Sherman Act* (1958), p. 257. A monopolist's entry into substitute products may enhance its monopoly power and forestall the development and introduction of competitive substitutes. Hale & Hale, *supra*, at 282–284; Burns, *The Decline of Competition* (1936), pp. 454–456. Absent monopoly power, interindustry expansion by internal growth may increase competition. Hale & Hale, *supra*, p. 265. Such a result does not follow from expansion by merger, whose immediate consequence is the elimination of an independent factor. This Court has pointed out that Section 7 of the Clayton Act favors growth by internal expansion and disfavors growth by mergers. *United States* v. *Philadelphia National Bank*, 374 U.S. at 370; *Brown Shoe Co.* v. *United States*, 370 U.S. at 345, fn. 72.

insulating effect. Consequently, it is of concern to the antitrust laws, because such mergers may well help to preserve and extend the unsatisfactory market structure of the concentrated industry.[20]

The importance of interindustry competition as an agency of deconcentration provides, we believe, the basis for testing mergers of the scope here involved. A merger's elimination of substantial interindustry competition can be a significant step towards increasing concentration by maintaining and extending the existing oligopoly structure. Like a merger creating undue market shares within an industry, an interindustry merger bringing together large firms, each being one of the few leaders in highly concentrated industries which are competing with one another on a broad scale, is one "whose size makes [it] inherently suspect in the light of Congress' design in § 7 to prevent undue concentration." *United States* v. *Philadelphia National Bank*, 374 U.S. at 363. As in *Philadelphia Bank*, it is appropriate and possible in this situation "to simplify the test of illegality." 374 U.S.

---

[20] The proposition that when an industry structure is unsatisfactory from the point of view of competition, interindustry competition is particularly to be prized, is supported by the analogy of the Congressional policy in regulated industries. Recognizing that limitation upon entry and other controls lessen the effectiveness of competition within each industry, Congress has taken pains to assure the effective competition of related industries by restricting the possibility of interindustry acquisitions. See Edwards, *Maintaining Competition: Requisites of a Governmental Policy* (1949), pp. 266–267. E.g., Interstate Commerce Act, Sec. 5, 49 U.S.C. 5; Federal Communications Act, Sec. 314, 47 U.S.C. 314; *Schaffer Transportation Co.* v. *United States*, 355 U.S. 83.

at 362. We submit that in such a case the government can satisfy its burden of showing that the merger may have the effect of substantially lessening competition by proving (a) the existence of substantial competition between two industries; (b) a high degree of concentration in either or both of the competing industries; and (c) the dominant positions of each of the merging companies in its respective industry.

This "test of illegality" omits analysis of statistics regarding market shares simply because those traditional yardsticks are generally unavailable to measure the full consequences which an interindustry merger would have on competition. The district court correctly analogized competition between glass and metal containers to other types of interindustry competition, such as that between copper and aluminum products; cotton, wool and synthetic fibers; and iron, copper and plastic pipe (R. 1604–1605, fn. 38). In each of those instances, companies from separate industries may compete through a great number of products for the business of an equally large range of customers, with varying competition from firms in other industries.[21] It may be possible to measure some portion of the anticompetitive effect of an interindustry merger in any of those areas by isolating a submarket in which market percentages are ascertainable because the participation of other industries is negligible or readily determinable. Although proof of a substantial lessening of competition in

[21] See Robertson, *On the Changing Apparatus of Competition*, 44 Am. Econ. Rev. 51, 54–57.

any such submarket would invalidate the merger under Section 7, it is obvious that this analysis would not fully reflect the over-all effect of the merger on competition.

Statistical demonstrations would be unsatisfactory with respect to such mergers for several reasons. First, the common product lines of the merging companies usually enjoy varying degrees of competition from other industries, and the volume of this competition is not subject to precise computation. Second, the particular merging firms may not presently compete *inter sese* in all the particular submarkets which would probably be affected by their merger. Since the merger forecloses the potential interindustry competitor's entry into submarkets in which the acquiring firm is active, its anticompetitive impact cannot be evaluated simply by adding present market shares.[22] Third, the larger the merging firms are the more likely is it that they produce a diversity of products

[22] The district court found, for example, that Hazel-Atlas was not presently a significant manufacturer of beer bottles and therefore rejected the contention that the merger would substantially lessen competition in the beer container line of commerce (R. 1630–1633). Although we do not contend here that the mere possibility that Hazel-Atlas might produce beer bottles was sufficient to affect competition in that "line of commerce," we do believe that the *total* of Hazel-Atlas' competitive potential in the particular submarkets served by Continental, particularly in light of the vigorous interindustry competition for new uses for glass and metal containers, the flexibility of production within the industry, the interchangeability of uses to which the same container may be put, and technological advances, requires recognition of Hazel-Atlas' status as a potential competitor in various submarkets now served principally by Continental and by other glass container companies.

with a multiplicity of end uses. It would be most unrealistic to appraise the impact of a merger between the country's largest industrial companies (*e.g.*, the leading steel and aluminum producers) by focusing only on one or several specific product lines and attaching conclusive effect to the percentage totals in such lines (*e.g.*, aluminum and steel kitchenware). The execution of the legislative judgment incorporated in Section 7 requires a more pragmatic appraisal of the anticompetitive consequences of such a merger than is provided by the ordinary statistical market analysis. It is our position that the three-pronged test of illegality suggested above is a more satisfactory and simpler method for determining whether an interindustry merger may substantially lessen competition in any line of commerce[23] than an examination of market percentages. We submit that an interindustry merger which meets these standards, no less than an intraindustry one which satisfies conventional market share percentage requirements, does "raise an inference that the effect * * * may be substantially to lessen competition." *United States* v. *Philadelphia National Bank*, 374 U.S. at 365. Whether this showing may be rebutted by other evidence, and what evidence would be pertinent, is not now in issue because the complaint was dismissed at the conclusion of the government's case.

[23] Since competition here is nationwide, there is no issue in this case as to the appropriate "section of the country." The test suggested above assumes, of course, that the industries compete in the same "section of the country" and that the merging firms are at least capable of competing in the same geographical area.

C. THE MERGER OF CONTINENTAL AND HAZEL-ATLAS SATISFIES THIS TEST AND THEREFORE VIOLATES SECTION 7

The record in this case supports the conclusion that the merger between Continental and Hazel-Atlas violated Section 7 because it was a combination of two dominant firms in competing and highly concentrated industries.

(1) Interindustry competition

The district court effectively described the competition involved in the present case, as follows (R. 1603–1604):[24]

> Concededly there was substantial and vigorous interindustry competition between these three industries and between various of the products which they manufactured. Metal can, glass container and plastic container manufacturers were each seeking to enlarge their

[24] For the purposes of this appeal, we are focusing upon competition between metal and glass containers. There can be no doubt, as the district court found, that plastic containers are, to some extent, also competitive with metal and glass containers; competition is also provided by paper, foil and other products, as we have noted (fn. 18, *supra*, p. 18). With respect to the industry specifically cited below, plastic containers, the total volume of commerce was, at the time of this merger, small compared to the overall interindustry competition between metal and glass containers. The court below noted that total sales of plastic containers in 1959 were only about $30 or $40 million; Continental's sales of such items in 1955 amounted only to $2.4 million (R. 1595). Obviously this comparatively small amount of commerce could have little impact on the vast competition between the $1 billion, 380 million sales of metal containers and approximately $830 million in glass containers (GX 800, 900; R. 1584, 2867, 3058). We believe that the government has met its burden of showing a violation of Section 7 relying upon Continental's production of metal containers, without regard to its sale in plastics, paper and other container materials.

> sales to the thousands of packers of hundreds of varieties of food, chemical, toiletry and industrial products, ranging from ripe olives to fruit juices to tuna fish to smoked tongue; from maple syrup to pet food to coffee; from embalming fluid to floor wax to nail polish to aspirin to veterinary supplies, to take examples at random.
>
> Each industry and each of the manufacturers within it was seeking to improve their products so that they would appeal to new customers or hold old ones. Hazel-Atlas and Continental were part of this overall industrial pattern, each in a recognized separate industry producing distinct products but engaged in interindustry competition for the favor of various end users of their products.

These findings were fully supported by evidence in the record and by undisputed conclusions reached by commentators who have considered these industries. As reflected in the literature on the metal and glass container industries, the two containers are functionally interchangeable and present alternatives to packers, whose competitive choice between them has varied with the commodity to be packed, their comparative cost, and other characteristics which affect the desirability of each.[25] Metal cans may be handled and stored easily,

[25] R. 1642; Hession, *The Metal Container Industry* in Adams ed., *The Structure of American Industry* (3d ed. 1961), pp. 458–460; McKie, *Tin Cans and Tin Plate* (1959), pp. 136–141, 295–296; Whitney, *Antitrust Policies; American Experience in Twenty Industries* (1958), Vol. II, pp. 222–223; Hession, *Competition in the Metal Food Container Industry 1916–1946* (1948), pp. 296–310; "Business at War; Glass v. Tin," *Fortune*, June 1945, p. 187; "American Can Co.," *Fortune*, January 1941, p. 53; "Billions of Bottles," *Fortune*, April 1932, p. 70.

and they have generally been cheaper than any glass containers other than reusable bottles. Glass containers offer the advantages of transparency and of consumer preference based on belief as to cleanliness, effect on taste and ease of storage of contents after opening. Use of glass containers increased substantially during the Second World War because of government controls on tin plate. Since then there has been intense rivalry for markets which has produced technological advances and other competitive responses. "Competition which in the past had been merely potential became active and aggressive."[26]

This interindustry rivalry also is a factor in pricing, as is illustrated by the testimony of the chairman of the board of Owens-Illinois Glass Co. that he takes into account the price of metal containers in pricing glass containers for beer, soft drinks, household and chemical products, and to a lesser degree for toiletries and cosmetics (GX 348–348h; R. 98, 2441–2457). Conversely, the president of U.S. Steel, in the TNEC hearings, stated that in arriving at prices for tin plate "other types of containers * * * always comes into our discussions."[27] And Continental's own concern with comparative prices is illustrated by its dissemination to sales personnel of price information on glass containers for beer (GX 438–439; R. 2705–2709) and by other internal memoranda (GX 434, 441, 588, 781; R. 2693–2699, 2727–2733, 2754–2757, 2825–2828).

---

[26] See Hession in Adams ed., note 7, *supra*, at pp. 458–460; "Business at War," *Fortune*, June 1945, p. 187.

[27] Hearings of the Temporary National Economic Committee, Investigation of Concentration of Economic Power, 76th Cong., 2d Sess., p. 10792 (1939).

In the district court, the government produced the most graphic evidence of the interchangeability of glass and metal containers—the fact that numerous products are packed in both types of containers. Investigators observed a great variety of goods being offered for sale competitively at retail stores throughout the country in both glass and metal containers. This was true in the food canning industry (pp. ~~51–56~~, *infra*), and in other end uses. Government investigators noted many items in toiletries and cosmetics, in medicinal and health products, and in household and chemical products, including in these categories such disparate articles as shaving cream, aspirin, and silver polish, being sold in both metal and glass containers (GX 949, 1158, 1160–1177, 1178A, 1178B, 1179–1201; R. 3069–3179).

The fact that at any given time some particular products may be packed preponderantly in one of these containers, to the almost total exclusion of the other, is of minimal significance. Consideration of only this static data (DX–N; R. 3389–3392) overlooks the dynamic nature of the competition between these two industries. Each exerts continuous pressure on its present and potential customers not only to increase its percentage share of products already packed in a particular type of container, but also to open up new commodities to the use of that type of container and to persuade the packers of these commodities to switch to such a container. The district court recognized, in considering the merger's effect on the beer container line of commerce, that Hazel-Atlas could, "at relatively little expense," convert its machinery to the production of a variety of glass

containers other than those being manufactured at the time of the merger (R. 1632). Such flexibility would enable glass container manufacturers to supply containers for a wide range of purposes since the same raw materials are used, the same production processes are followed, and the same channels of distribution are employed irrespective of the ultimate shape or function of the glass container (R. 1588). The same is true of metal containers (R. 1587).

The fact that metal and glass containers are not identical in price or in all quality characteristics merely illustrates the choice provided for packers so long as the two industries are in active competition. This choice may be guided by a packer's estimate of the relative desirability of each of these containers, and the advantages of each are fully exploited and emphasized only when the two industries compete. Beer, for example, is packed extensively in metal and glass containers, and the development of the beer can, which in turn prompted the production of cheaper and lighter weight non-returnable bottles,[28] illustrates the effect of interindustry competition on technological development. The record also shows how container manufacturers appraised the elements of relative cost, convenience and consumer preference in attempting to persuade brewers to utilize either glass or metal containers (GX 31, 114–116, 124, 127, 130, 434–436, 438, 440 440A, 445, 446, 448, 543, 588, 589; R. 1667, 2132–2139,

[28] McKie, note 25, *supra*, pp. 139–140; Hession, *Competition in the Metal Food Container Industry 1916–1946* (1948), pp. 299–304.

2196–2197, 2204–2207, 2221–2222, 2693–2705, 2709–2727, 2738–2760)."

This competitive pressure is illustrated in the record by Continental's own efforts to break into a field largely dominated by glass containers at the time of this trial—the bottling of soft drinks. Continental not only offered these packers the familiar flat-top style metal container for soft drinks but, after years of development and research, produced a specially designed cap-sealed container. It energetically extolled the virtues of utilizing metal containers by making favorable comparisons of the costs of shipping the two containers, their relative speed of filling, and the investment required to convert a packing line from glass to metal containers (GX 600, 642; R. 2761–2779, 2804–2807). Continental carefully watched the introduction of soft drinks in metal containers in a limited area by one packer, and estimated the total potential market in carbonated beverages as about 23 to 25 billion bottles per year. Although Continental was not certain to what extent it could penetrate "this tremendous market", it estimated the potential for metal containers as between 700 million

[29] While Hazel-Atlas had not become a significant factor in the production and sale of beer bottles at the time of merger, its shipments of such containers had increased to about 17,136,000 in 1957 (GX 800–801; R. 2875, 2876, 2959), and internal memoranda evidence its interest in this field (GX 777–779; unprinted). More important, Continental regarded its acquisition of Hazel-Atlas as one step towards developing "a complete line of glass jars and bottles including beverage bottles" the full consummation of which contemplated a further acquisition of a company already in the beverage bottle business (GX 900; R. 3031).

and 1,250 million, on "a conservative basis" (GX 600B; R. 2781–2785).

It also studied market surveys taken to test consumer acceptance of soft drinks in metal containers (GX 601; R. 2785–2788), considered the attitude of grocery chains toward this method of packaging (GX 612; R. 2789–2790), planned new improvements in its container designed to overcome past objections to the ability of metal containers to withstand the internal pressures generated by soft drinks (GX 613, 684; R. 2790–2796, 2818–2819), and conducted an extensive comparison of the economics of soft drinks packed in metal and glass containers (GX 617; R. 2797–2801).

That this was active, aggressive competition is confirmed by the response of the still-dominant purveyors of glass containers. Owens-Illinois took the price of metal containers into account when pricing its glass containers for the soft-drink industry (R. 98), expressed concern with the active competition in soft drinks being provided by metal containers (GX 235c; R. 2293), and urged active solicitation of bottlers to keep the competing containers as much out of the field of soft drinks as possible (GX 235d; R. 2299). The Glass Containers Manufacturers' Institute carried on extensive market research and promotion to aid its members in continuing their dominance of the bottlers' business,[30] conducted surveys of consumer attitudes concerning the competing containers,[31] and clearly

[30] GX 47–51, 62–71, 73, 85–113, 118–123; R. 321–322, 957–958, 1881–1890, 1915–1941, 1944–1946, 2049–2130, 2141–2196. In turn, United States Steel Company placed advertisements in periodicals of the bottling industry which extolled the virtues of soft drinks in metal containers (GX 170B–177; R. 2255–2267).

[31] GX 80–82, 84; R. 1970, 1978, 1979, 1982, 2008, 2009, 2011, 2012, 2016–2018, 2023, 2042–2047.

recognized "the seriousness of the competition from soft drink cans" (GX 85; R. 2051).

Similar efforts were made with respect to the packaging of instant coffee—a food product which was being packed almost exclusively in glass containers (DX N; R. 3390). Detailed studies and advertising campaigns were conducted by Continental in an attempt to capture for the metal container industry some portion of this substantial market (GX 404, 405, 405A, 406, 407, 408, 409, 411, 412, 413; R. 2553–2613). Active competition existed with respect to detergents (R. 107–134, 365; GX 429; R. 2671–2693) and pharmaceuticals (GX 695, 422, 702–703; unprinted; R. 355, 364). And Owens-Illinois conducted studies comparing the cost of metal and glass containers for detergents and polish (GX 348 h; R. 2457–2458), of metal, glass and plastic containers for liquid detergents (GX 349 A, 349B; R. 2461–2468), and of metal and glass aerosol containers (GX 348 h; R. 2457). The Glass Container Manufacturers' Institute also carried on an extensive program of market research and promotion to foster the use of glass containers for toiletries and cosmetics, chemical and household products, and medicinal and health items (GX 33, R. 1691, 1703–1707, 1715, 1717, 1761).

In summary, it has been fully demonstrated in the record that one of the characteristics of the metal and glass container industries is that of constant rivalry whereby packers are, by reason of technological advances and other efforts of each industry, continuously offered the opportunity to transfer their products from one type of container to the other. An inter-

industry merger in this context clearly terminates such flexible competition between the merging firms and not only forecloses competition insofar as the two companies are presently rivals in any submarket but also shuts off all initiative to expand into one another's realm.

(2) Concentration

The extremely high concentration of the metal and glass container industries cannot be gainsaid. The metal container industry is recognized as a "duopoly," with two companies—American Can Company and appellee Continental—leading and dominating this vast field.[32] In terms of the volume of cans, American Can Company, before the merger, accounted for about 40 percent of industry shipments, and Continental accounted for about 32.6 percent (GX 801; R. 2962). Thus, these two companies alone represented about 72.6 percent of the market; below these the market shares fell off precipitously to about 5 percent for National Can Company (GX 801; R. 2962). The remaining 23 percent of the market was divided among 75 to 90 relatively small firms (R. 1590).

The glass container industry presents a similar—though less extreme—picture of concentration, led by three large companies holding about 55.4 percent of the market. These are Owens-Illinois Company, accounting for about 34.2 percent of all shipments of glass containers, Anchor-Hocking Glass Company,

[32] See McKie, *Tin Cans and Tin Plate* (1959), pp. 83–92, Whitney, *Antitrust Policies: American Experience in Twenty Industries* (1958), Vol. II, p. 201; Hession, *Competition in the Metal Food Container Industry 1916–1946* (1948), ch. 3.

with 11.6 percent, and Hazel-Atlas with about 9.6 percent (GX 801; R. 2956). The remaining 44.6 percent were split among some 39 other companies (R. 1593).

Furthermore, the metal and glass container industries were among those specifically and repeatedly referred to in Congress during the passage of amended Section 7. These industries thus demonstrated the dangerously high level of concentration already reached in many areas of the country's economy and the necessity of preventing further concentration and the consequent adverse impact upon competition.[33]

(3) Dominance

The size and importance of the two merging companies are outstanding. Continental's 32.6 percent of the industry shipments represents 13 billion metal containers out of the nation's aggregate shipments of 39¾ billion containers in 1955 (GX 801, R. 2962). In terms of dollar volume, Continental's sales of metal containers that year were $433 million, or 31.4 percent of the industry's gross sales of $1,380,000,000 (GX 900, R. 3057–3058). Continental, like American Can, has the competitive advantage of having its metal container plants located throughout the country (R. 413–415; fn. 32, *supra*).

The over-all size of Continental is also of considerable significance in appraising its significance as a

[33] Hearings before Subcommittee of the Senate Judiciary Committee on H.R. 2734, 81st Cong., 1st and 2d Sess., pp. 5–6, 17, 28; 95 Cong. Rec. 11502; A6120; 96 Cong. Rec. 16436, A570; Hearings before Subcommittee No. 2 of House Judiciary Committee on H.R. 515, 80th Cong., 1st Sess., pp. 305, 314; Federal Trade Commission, Report, The Concentration of Productive Facilities, 1947, pp. 32–33, 80–82; Report on The Merger Movement, A Summary Report, pp. 35–36.

competitive force. Prior to the merger, Continental had assets of $382 million including 72 domestic plants, and annual gross revenues of $666 million. The acquisition of Hazel-Atlas was part of its program to develop a complete line of container and packaging products (GX 900, R. 3049–3052) and it clearly had the resources to attain this objective, either by internal expansion or acquisition.

Hazel-Atlas' 10 percent of glass container shipments amounted to one billion 857 million containers of the 19⅓ billion glass containers shipped in the continental United States in 1955 (GX 801; R. 2956). Before the merger, it had annual sales of more than $79 million and assets of more than $37 million, including 13 plants (GX 1210; R. 8, 11, 3222, 3249–3250). For two generations, it has maintained its position as an industry leader. It was an early pioneer in container manufacturing machinery and, more recently, it developed the glass container for baby food which has replaced the metal can in most of this market (R. 338–339). Up to the time of the merger, Hazel-Atlas had an uninterrupted profit record (R. 337).

That this merger is the sort contemplated by the terms of Section 7 appears from reports of the Federal Trade Commission as well as from studies made by others who have analyzed the industries. In the Federal Trade Commission's studies of industry concentration which are part of the legislative history of Section 7, Continental's acquisitions of companies in related container fields were cited as examples of "substitute product acquisitions," and these

were assertedly a common class of horizontal merger which represented the present-day threat of industrial concentration by merger. Federal Trade Commission, *The Merger Movement: A Summary Report*, pp. 35–36. See also Federal Trade Commission, *The Present Trend of Corporate Mergers and Acquisitions*, S. Doc. No. 17, 80th Cong., 1st Sess., p. 12. And commentators have pointed explicitly to the dangers to competition from mergers between producers of metal and glass containers. The "quiescent state" of price competition within the metal container industry has been thought sufficient to warrant the prevention of any merger which would reduce interindustry competition.[34] In adidtion, a warning has been issued against the long-run possibility of a series of mergers combining metal and glass container manufacturers, which would have serious anticompetitive consequences and which should be prevented in their incipiency.[35] Approval of the Continental-Hazel-Atlas merger might require approval of similar transactions by rival firms (*Brown Shoe Co.* v. *United States*, 370 U.S. at 343–344), and the result would be the extension of one oligopolistic pattern of structure and behavior over both industries.

We submit that there is ample evidence in the record to warrant a finding that the merger amounted to a violation of Section 7. The district court's contrary conclusion was apparently the result of its misapplication here of this Court's criteria for de-

[34] Hession, *Competition in the Metal Food Container Industry, 1916–1946* (1948), p. 331.

[35] McKie, *Tin Cans and Tin Plate* (1959), pp. 295–296.

termining the existence of monopoly power violative of the Sherman Act, as set out in *United States* v. *E. I. du Pont de Nemours & Co.*, 351 U.S. 377. The court (R. 1604) relied upon the passage in *du Pont* which stated (351 U.S. at 393):

> * * * one can think of building materials as in commodity competition but one can hardly say that brick competed with steel or wood or cement or stone in the meaning of Sherman Act litigation; the products are too different. This is the interindustry competition emphasized by some economists. See Lilienthal, Big Business, c. 5.

But this language must be read in its context, explaining that a monopoly position in a recognized industry such as steel would violate Section 2 of the Sherman Act, and would not be justified by the availability of brick.[36] As elucidated in the extensive literature prompted by the *du Pont* case, the problem under Section 2 is that all substitutes, however re-

---

[36] Similarly, *Times-Picayune Publishing Co.* v. *United States*, 345 U.S. 594 (1953), relied upon below (R. 1605), was concerned with whether a company had a "monopolistic" or "dominant" position in the market for one product, which the Court said was required to invalidate, under the Sherman Act, the tying of another product to it, and the question was the extent to which the sole morning newspaper's dominance was diluted by afternoon papers. In view of appellees' apparent contention that the district court did not disparage interindustry competition (Motion to Dismiss or Affirm, p. 8), it is instructive that the district court's misapplication of the *du Pont* case followed the reasoning urged on it by appellees' counsel, that in *du Pont* "the Supreme Court rejects interindustry competition as a criterion in the determination of the metes and bounds of the relevant market" (Tr. 3835, unprinted).

mote, do limit a monopolist's power somewhat, and that a line must be drawn excluding some substitutes if the concept of monopoly is to retain any meaning." Neither this approach, nor the Court's opinion in *du Pont*, ignores the competition provided by substitutes or sanctions restraints upon it. Implicit in all the discussions of this case, indeed, is a recognition of the pervasiveness of interindustry competition.[32] When shifting to merger law, therefore, it is essential to recognize that, as one writer has pointed out, "both intraproduct and interproduct competition may be important and either may be substantially lessened."[33]

---

[31] *E.g.*, Report of Attorney General's Committee to Study the Antitrust Laws (1955), p. 322; Dirlan & Stelzer, *The Cellophane Labyrinth*, 1 Antitr. Bull. 633; Hale & Hale, *Market Power: Size and Shape under the Sherman Act* (1958), pp. 105–113; Stocking, *Workable Competition and Antitrust Policy* (1961), pp. 274–277; Stocking & Mueller, *The Cellophane Case and the New Competition*, 45 Am. Econ. Rev. 29; Turner, *Antitrust Policy and the Cellophane Case*, 70 Harv. L. Rev. 281.

[32] The holding of *du Pont* itself refutes the view of the court below that physically dissimilar products cannot usually be in the same relevant market for antitrust purposes. For this Court rejected the government's contention that du Pont's 75 percent control over cellophane violated the Sherman Act, on the precise ground that the relevant market was "flexible packaging materials"—including such widely different products as aluminum foil, vegetable parchment and waxed paper, because competition from these products effectively limited du Pont's ability to control the price of cellophane. The Court stressed that "Illegal power must be appraised in terms of the competitive market for the product", a scrutiny in realistic terms, without limitation to "physically identical products" (351 U.S. at 393–394).

[33] Turner, *Antitrust Policy and Cellophane Case*, 70 Harv. L. Rev. 281, 315, fn. 80.

More appropriate than the dictum in *du Pont* upon which the district court relied was the actual holding in that case that the broader category of flexible packaging materials, rather than the narrower cellophane industry, was the relevant market for determining whether du Pont had violated Section 2 of the Sherman Act. The Court pointed out that "[i]ndustrial activities cannot be confined to trim categories" (351 U.S. at 395), and that "despite cellophane's advantages, it has to meet competition in every one of its uses" (351 U.S. at 399). Just as cellophane and Pliofilm were regarded in *du Pont* to be competing packaging materials for meat packers and other packaging customers (351 U.S. at 399–400), so are glass and metal containers in competition in this case for the business of all users of such containers. When, as here, the legality of an interindustry merger is at issue, it is particularly appropriate to consider the challenged conduct in light of this broader market.

II

THIS MERGER VIOLATED SECTION 7 OF THE CLAYTON ACT BECAUSE ITS PROBABLE EFFECT WAS SUBSTANTIALLY TO LESSEN COMPETITION IN THE PRODUCTION AND SALE OF CONTAINERS FOR THE FOOD CANNING INDUSTRY

Although we contend that apart from market share analysis this merger violated Section 7 because of the positions of the merging firms in competing and highly concentrated industries, we are prepared to demonstrate that the merger's anticompetitive effect on a single submarket—the production and sale of containers for the food canning industry—as disclosed by the record is sufficient to sustain the government's burden of proof. Among the end uses common to Continental's metal containers and Hazel-Atlas' glass containers, food canning was chosen by the government as one of the most significant in terms of substantiality of commerce and in terms of public and industry recognition. We submit that the manufacture and sale of containers for the food-canning industry is an area of effective, realistic competition between Continental and Hazel-Atlas and an appropriate line of commerce for Section 7 purposes, and that the district court erred in reaching a contrary conclusion. With respect to this line of commerce the government met its burden of proving anticompetitive consequences, even if statistical proof be requisite, since its evidence demonstrated that the market share of the merged company together with the resulting increase in concentration rendered the merger "inherently likely to lessen competition substantially." *United States* v. *Philadelphia National Bank*, 374 U.S. at 363.

A. THE PRODUCTION AND SALE OF CONTAINERS FOR THE FOOD CANNING INDUSTRY IS A RELEVANT PRODUCT MARKET FOR SECTION 7 PURPOSES

"Food canning," as defined by the container industry, is the process of hermetically sealing and heat-sterilizing food (R. 698–699).[40] This process bears upon competition between metal and glass containers because, as was testified by qualified experts, only these two containers have the requisite physical properties for thus "canning" food.[41] The "literally thousands of packers purchasing containers for packing hundreds of food products," to which the district court referred (R. 1642), must choose between these two types of containers if they wish to take advantage of the protection against food spoilage and deterioration afforded by the canning process. In this field metal and glass containers are functionally interchangeable, and no containers other than these compete.

There can be no doubt that this proposed line of commerce is "substantial." *United States* v. *E. I. du Pont de Nemours & Co.*, 353 U.S. 586, 595. The National Canners Association estimated that the market annually comprised 22 billion metal and glass

[40] Heat-sterilizing is a protective measure applied after the food has been sealed in glass or metal hermetic containers. It consists, basically, of heating the filled containers under pressure to a temperature which is calculated to destroy all, or essentially all, of the bacteria present in the food which would have a tendency to spoil it, and then cooling under controlled conditions (GX 317, 318, R. 2337–2440). A hermetic seal, impermeable to air and other gases, is needed to keep the contents sterile.

[41] See, *e.g.*, R. 63, 71–75, 180, 304–305.

containers in which were packed about 8½ percent of the nation's food supply.[42] A line of commerce may, of course, be defined in terms of a substantial class of customers even though the same product is also used by others; the Court in *du Pont* defined a relevant market of finishes and fabrics in terms of users by drawing the product market "coextensive with the automobile industry." *United States* v. *E. I. du Pont de Nemours & Co.*, 353 U.S. at 593–595, and dissenting opinion at 650–654.[43] Manufacturers may sell the same container for food and nonfood uses (R. 1587, 1588), but from the point of view of the users—*i.e.*, the large well-defined industry of food canning—the elimination of any container manufacturer diminishes the choices available to them. We believe that it comports with "trade realities" (*United States* v. *Philadelphia National Bank*, 374 U.S. at 357) to measure the impact of this merger in the market defined by this category of end use.

As has been previously demonstrated, there is substantial competition between the glass and metal container industries for a multitude of end uses. This competition is no less intense with regard to food

[42] GX 133, p. 3 (unprinted). The district court admitted into evidence these over-all figures for canning, with leave to the appellees to introduce their own statistics (R. 716). These figures are being used here not as proof of the precise quantity involved but merely to demonstrate that the market is a large one.

[43] See also *Crown Zellerbach Corp.* v. *Federal Trade Commission*, 296 F. 2d 800, 807, 813 (C.A. 9), certiorari denied, 370 U.S. 937; *Reynolds Metals Co.* v. *Federal Trade Commission*, 309 F. 2d 223, 228–229 (C.A. D.C.); *A. G. Spalding & Bros.* v. *Federal Trade Commission*, 301 F. 2d 585 (C.A. 3).

canning than it is elsewhere. Among the many products observed by government field investigators in retail stores for sale in both metal and glass containers were more than 100 food items, including applesauce, pears, peaches, peas, beans, tomato juice, sardines, peanut butter, and ranging even to caviar, papaya and tamales (GX 949, 1158, 1160–1177, 1178A, 1178B, 1179–1201; R. 3069–3179). Variations among these items as to quality and price merely demonstrate the competitive choice available to the food packers and ultimately to the consuming public. Manufacturers of glass containers stress the transparency of their product, its greater attractiveness, and its ease of storage and re-use (GX 669, 671; R. 957–958, 2814–2816). Metal container manufacturers, on the other hand, emphasize the facts that their products are cheaper to fill, easier and less expensive to ship, and less bulky (GX 675; R. 2817).

This competition is reflected in the activities of the respective trade associations. The records of the Glass Container Manufacturers' Institute (GCMI), of which Hazel-Atlas was a member, contain, for example, letters exchanged with glass container manufacturers complaining of the vigorous competition from firms making metal containers, specifically Continental." The aspirations of glass container manu-

" *E.g.*, Letter from Director, Market Research and Promotion, GCMI, to president of a member firm: "Both of these letters from Continental [distributed in the St. Louis area] burn me up. The first one is really very vicious in its handling of breakage and glass chips and of course the second one is greatly exaggerated as to the savings that could be effected by purchasing baby food in cans." (GX 1, 3; R. 1657–1661).

facturers to increase their share of the food market is reflected in their concern with advertising, extensive customer surveys, and store audits conducted in cities throughout the country (GX 14, 47–56, R. 1661–1662, 1881–1905). These marketing devices studied the glass container manufacturers' share of the market for baby food (GX 42–46, R. 1867–1880), and for food generally, and attempted to measure customer motivation in choosing food in a particular container (GX 84, R. 2005–2047). The Can Manufacturers Institute (CMI), of which Continental was a member, conducted comparable activities on behalf of its members' interests in promoting the use of metal containers for food at the expense of glass containers (GX 145, 147, 148, 156, 158, 166; R. 2245–2253). An example of these activities, especially in relation to containers for food, is found in the Fifth Annual Consumer Survey on Containers, prepared for CMI by Benton & Bowles, Inc. The stated purposes of the survey, and its summary of results clearly demonstrate the broad scope of the competitive efforts of the metal container manufacturers (GX 138, R. 2229–2244).

In addition, food packers themselves recognize that metal and glass container manufacturers are competing for their business. They have not hesitated to warn Hazel-Atlas and other glass container manufacturers that if glass prices rose too high, their foods would be packed in metal containers (GX 775, 776, R. 2822–2834). In at least one instance, a food packer has succeeded in obtaining a reduced price for glass containers by such a threat (GX 773, R. 2821–2822).

The fact that at any particular time certain foods are "canned" predominantly in one or the other of these competing products (DX–N, R. 3389–3392) is not significant. The nature of the interindustry competition is such that it is never static, and the container manufacturers engage in constant competition to draw new products to their particular type of container. See pp. 25–33, *supra*. A cogent illustration is the history of baby food packaging:

Baby food, once packed entirely in metal cans,[45] was estimated to have been divided 80 to 20 percent in favor of glass containers at the time of trial (DX–N, R. 3389). Hazel-Atlas played a substantial part in this shift by designing the container which "has become the typical baby food jar" (R. 338). Containers for these products had been one of Hazel-Atlas' major lines as far back as 1922 or 1923, when it sold to all of the major producers of such food—Clapp, Beechnut Company, H. J. Heinz, and Libby, McNeill & Libby (R. 333–334).[46] In response to the contemporary dominance of glass containers in this field, Continental intensively endeavored to increase its share of this business. Comparative costs were carefully studied, although customer preference for glass

[45] McKie, *Tin Cans and Tin Plate* (1959), p. 138.

[46] Hazel-Atlas produced these containers with a Miller machine, which was the best available until the advent of the more efficient Hartford-Empire IS machine. Thereafter, after 1941 or 1942, Hazel Atlas' share of the baby food container business tapered off, due primarily to its lack of the more efficient machine (R. 339–341). However, Hazel-Atlas had plans to obtain more Hartford-Empire machines and had several on order prior to the merger (GX 363, 364, R. 2470–2518).

was noted (GX 400A, R. 2532, 2535); a list of packers of baby food was compiled, as well as a chart of the size of the baby population between the ages of 3 months and 2 years—both packers and babies being potential customers in this market (GX 415, unprinted); and advertising campaigns designed to overcome mothers' prejudices against metal containers were conducted (GX 415B, 415C, R. 2614–2627). Advertising agencies studied "the relative use of brands and the attitude of women toward the use of tin cans versus glass as containers for baby food" (GX 416, R. 2630, 2628–2632). Similar in-depth studies of consumer preferences were used as bases for considering redesign of the metal container then used for baby food and for measuring the results of previous advertising campaigns (GX 415B, 417, 419A–C, 420, R. 623, 2622, 2632–2649).

The record discloses many instances other than the packing of baby food in which Continental and Hazel-Atlas competed before their merger for the business provided by food canners. Hazel-Atlas was for years the industry leader in wide mouth ware, the containers predominantly used for food canning (R. 335). A former general sales manager and member of its board of directors described Hazel-Atlas as being "always food-minded" (R. 335, 357) and declared further that food containers had been the company's "main product" (R. 333). The list of foods which, according to the record, were packed in Hazel-Atlas containers included vegetables, fruits, fruit and vegetable juices, catsup, vinegar, syrup, salad dressing, jams, preserves, pickles, mayonnaise,

maraschino cherries, olives, mustard, honey, peanut butter, and beef steak (R. 358–360, 362–363).

The record specifically demonstrates competition between Continental and Hazel-Atlas in seeking to sell containers to pack fruits and vegetables.[47] Moreover, Continental collected data on the comparative costs of metal and glass containers for packaged syrups (GX 400A, 401, R. 2536, 2541–2544) and on the market for peanut butter in cans (GX 402, R. 2544–2553). Indeed, Continental's "Savorlock" can was proposed as a substitute for glass jars in a wide variety of products (GX 404, R. 2553–2563). Consideration was also given by Continental to packing consumer sizes of tomato catsup in metal containers, although it was recognized that it had theretofore been "packed exclusively in glass in retail sizes." This was, nevertheless, considered "a potential market" for Continental (GX 421A, R. 2650–2654). Aerosol metal containers, a market which Continental believed was rapidly expanding, were also promoted for barbecue sauce, catsup, chocolate syrup, salad dressings, and whipped toppings (GX 423–427, 806, R. 185, 2654–2670, 3036–3042).

Thus, as forcefully shown by the activities of Continental and Hazel-Atlas themselves, and by their respective trade associations, there was substantial present and potential competition between the merging firms and between glass and metal container manufacturers for the business of the food canning industry

[47] Continental: GX 400; R. 2519–2528; GX 400A, R. 2534. Hazel-Atlas: R. 362.

and of the packers making up this vast market. Containers for the food canning industry, *i.e.*, those which are sold to pack hermetically sealed and heat sterilized foods, therefore constitute a line of commerce for Section 7 purposes.

B. THE MERGER MAY SUBSTANTIALLY LESSEN COMPETITION IN THIS MARKET BECAUSE IT RESULTS IN A SINGLE FIRM WITH AN UNDUE MARKET SHARE AND SIGNIFICANTLY INCREASES CONCENTRATION

Section 7 requires a determination whether, in any of the relevant lines of commerce, "the effect of [the] acquisition may be substantially to lessen competition * * *." This Court has observed that in making the statutory determination, "[t]he market share which companies may control by merging is one of the most important factors to be considered" (*Brown Shoe Co.* v. *United States*, 370 U.S. 294, 343), and that, in very large mergers, the government's case may be established on the basis of market share percentages alone: "[A] merger which produces a firm controlling an undue percentage share of the relevant market, and results in a significant increase in the concentration of firms in that market is so inherently likely to lessen competition substantially that it must be enjoined * * *" (*United States* v. *Philadelphia Bank*, 374 U.S. 321, 363). We submit that on the present record the illegality of this merger may be established on the basis of such market share data showing the impact upon the production and sale of containers for food canning.

Customarily, market shares are derived directly from statistics as to sales of the merging companies

within the relevant market, and the total of such sales by all competing companies. This provides a "meaningful base" to reflect the commercial realities prior to the merger.[48] The approach to such statistics must necessarily be a practical one, if Section 7 litigation is to remain manageable. Thus, this Court in *Brown Shoe* approved the reliance upon a market sample and stressed that "in cases of this type precision in detail is less important than the accuracy of the broad picture presented" (370 U.S. at 340–343, and fn. 69, p. 342). In *United States* v. *Philadelphia National Bank*, the Court acknowledged that it had no precise market share data dealing with all banking business derived from the particular relevant geographic market; it took the available statistics, which reflected the business of banks located only within the market and did not specify the source of their business, and made practical adjustments and allowances to arrive at a fair "conservative estimate" of the companies' market position (374 U.S. at 364, fn. 40).

This record does not contain precise statistics dealing with the production and sale of all containers used by food canners in packing hermetically sealed, heat-sterilized foods. No such statistics appear to

---

[48] "Although the sum of the parties' pre-existing shares of the market will normally equal their combined share of the immediate post-merger market, we recognize that this share need not remain stable in the future. Nevertheless, such statistics provide a graphic picture of the immediate impact of a merger, and, as such, also provide a meaningful base upon which to build conclusions of the probable future effects of the merger." *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 343, fn. 70. See *Crown Zellerbach Corp.* v. *Federal Trade Commission*, 296 F. 2d 800 (C.A. 9), certiorari denied, 370 U.S. 937.

be available.[49] Consequently, there are no precise data concerning the merging firms' shares of this relevant product market. However, this gap should not prevent this Court from judging the merits of the merger by the available meaningful percentages.

Introduced into evidence at the trial was a table listing, in thousands of units and by percentages, the total shipments of glass and metal food containers within the continental United States in 1955, 1956 and 1957 (GX 801(3c), R. 2969).[50] The district court correctly observed that these statistics included glass and metal containers used for food generally "and were not limited to containers for foods which were heat sterilized and hermetically sealed" (R. 1638). However, we believe that these statistics, which are the only ones available, provide an accurate enough measure of the shares of the food "canning" market held in 1955 by each of the leading firms in the glass and metal container industries to test the legality of this merger. This is because the evidence pertaining to these industries demonstrates, as the district court

[49] The Census Bureau does not collect figures for this end-use of metal and glass containers. See the Census categories listed by the district court, R. 1587–1589.

[50] The data on glass container shipments were drawn from industry reports of shipments, by units of containers, to the Bureau of the Census and to the Glass Container Manufacturers Institute (GX 801; R. 2956). Metal container shipments are reported to the Bureau of the Census by area measurement of steel plates consumed in the manufacture. Through the use of conversion figures of the Census Bureau and the Can Manufacturers Institute, these statistics were converted to units of containers. The computations were explained at the trial (R. 1194–1315, 1320–1322, 1327–1447; See GX 1202, 1205; R. 3181–3211, 1586–1587, fn. 26).

found, that there is a sufficient flexibility of manufacture and use so that each of these firms could as readily produce containers for hermetically sealed heat-sterilized foods as for other types of packaged food products and that, indeed, the identical containers are often used for both of these purposes (R. 86, 89–90, 103, 411, 1587–1588, 1641, 1643). Consequently, there is no reason to believe that either Continental or Hazel-Atlas produced and sold any lesser percentage of "canned" food containers than of total food containers in 1955. Indeed it is noteworthy that both these firms had substantially the same percentage of the food container production in that year as they had of the *total* "food, non-food, beer, soft drink and beverage" container production during 1955 (GX 801(3b), R. 2968). This further supports the inference that leading producers in each of these industries were able to sell their products in roughly equal shares among the major possible end uses because of the flexibility of manufacture and use.[51] Moreover, as has previously been shown

[51] The total container production figures are Continental 21.9 percent, Hazel-Atlas 3.1 percent (R. 2967). It should be noted that the adaptability of all container production to the satisfaction of the needs of food canners makes these total production figures independently relevant, since they provide a meaningful estimate of the potential scope of the choices available to food canners. That such potential choices among metal and glass container manufacturers are not merely theoretical but are actually available to food canners, is shown by the further findings of the district court, that there are no specialized vendors of containers for food purposes, that such containers were not sold or shipped differently from containers for other uses and that packers ordinarily use multiple sources of supply (R. 1641, 1643).

(pp. 42–47, *supra*), the record reflects affirmatively that both Continental and Hazel-Atlas were heavily engaged in providing containers for the food "canning" industry. Hence it is fair to infer—particularly in the absence of any proof by the appellees—that a large portion of the food containers produced by these firms were used for food "canning."

If these percentages are accepted, as we think they should be, Continental has been shown to have held about 23 percent of this product market prior to the merger, and Hazel-Atlas has been shown to have held about 3 percent. The merger therefore raised Continental's share of the market to about 26 percent, an increase of more than 12 percent. Before the merger Continental was the second largest manufacturer of containers suitable for food canning; Hazel-Atlas was the sixth. The other industry leaders were American Can Company (29 percent), Owens-Illinois Glass Company (7.9 percent), Anchor-Hocking Glass Company (4 percent), and National Can Company (3 percent). Accordingly, the effect of the acquisition was to increase the total share of the three largest firms by about 5 percent of their prior total percentage share; after the merger they held 63 percent of this product market.

We submit that such an increase in market shares is sufficient to "raise an inference that the effect of the contemplated merger of appellees may be substantially to lessen competition" in the manufacture and sale of containers for food canning, since it "produces a firm controlling an undue percentage share of the relevant market and results in a significant increase in the concentration of firms in that market." *United*

States v. *Philadelphia National Bank*, 374 U.S. at 363, 365.

In *Philadelphia Bank*, the Court, dealing with the market shares before it, held that a 30 percent market share held by the merged company was an "undue" percentage, and that an increase of more than 33 percent in the concentration of business in the two largest companies was a "significant" increase (374 U.S. at 364–365). Noting that various writers had proposed more rigorous tests under Section 7,[52] the Court stressed that a less substantial increase than was present in *Philadelphia Bank* would not *ipso facto* render the merger lawful (374 U.S. at 364, fn. 41). It pointed out that "if concentration is already great, the importance of preventing even slight increases in concentration and so preserving the possibility of eventual deconcentration is correspondingly great" (374 U.S. at 365, fn. 42).

While the percentages here are smaller than in *Philadelphia Bank*, we believe they are sufficient to give rise to the inference of illegality. As has been more fully discussed at pp. 33–36, *supra*, this merger takes place in industries in which oligopolistic structures are already far advanced and well entrenched. Moreover, the impact of interindustry competition to counteract the anticompetitive effects of concentration within an industry (pp. 16–17, 19–21, *supra*) is particularly marked in the food canning industry, in which

[52] The Court noted the views of several commentators who suggest that any acquisition by a firm controlling 20 or 25 percent of a market be considered presumptively unlawful. Another economist urges that an increase in market concentration of 7 or 8 percent should require the same result. *United States* v. *Philadelphia National Bank*, 374 U.S. at 364, fn. 41.

competitive innovation and price bargaining has occurred which might not have resulted without interindustry competition. Finally, further mergers of this sort between metal and glass manufacturers would have the accelerated anticompetitive consequence of combining two competing leaders in their respective oligopolistic industries.

Preventing such results in their "incipiency" was the Congressional intent in adopting the amended Section 7. In these circumstances, we believe that the market shares in food canning resulting from this merger were sufficient to raise an inference that competition would be substantially lessened. Accordingly, we believe that the government has met its burden of showing that the merger was proscribed because of its anticompetitive impact, even if the only line of commerce in which such effects are evaluated is the production and sale of containers for the food canning industry.

CONCLUSION

For the foregoing reasons the judgment below should be reversed and the case remanded for further proceedings.

Respectfully submitted.

OCTOBER TERM, 1963.

No. 367

UNITED STATES OF AMERICA, Appellant,

v.

CONTINENTAL CAN COMPANY, INC. and
HAZEL-ATLAS GLASS COMPANY.

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE SOUTHERN DISTRICT OF NEW YORK.

BRIEF FOR CONTINENTAL CAN COMPANY, INC.

Question Presented.

The sole question presented for decision on this appeal is this:

> Was the district court correct in dismissing a complaint charging a violation of Section 7 of the Clayton Act when, on completion of the government's case, the record was absolutely barren of evidence of actual or reasonably probable lessening of competition or tendency to create a monopoly in any line of commerce as a result of the acquisition in question?

Statement.

This is a direct appeal from the judgment of the district court holding that the acquisition of Hazel-Atlas Glass Company (Hazel-Atlas) by Continental Can Company, Inc. (Continental) did not violate Section 7 of the Clayton Act, 15 U. S. C. §18.

The government's complaint was dismissed by the district court because of a failure of proof of either actual anti-competitive effects flowing from the acquisition, or reasonable probability that the forbidden anti-competitive effects would result in the future, in any line of commerce.

The Acquisition.

Continental acquired all of the assets and assumed all of the liabilities of Hazel-Atlas on September 13, 1956. Since that date the acquired business has been operated by Continental. Hazel-Atlas was dissolved late in 1956.

Prior to the acquisition, Continental's principal business was the manufacture and sale of metal cans and other metal containers. Other products included paper cups and plates, fibre drums, kraft linerboard, flexible packaging materials, crown caps, vacuum type metal caps, plastic containers and can closing machinery (Op. R. 1583).[1] It did not manufacture or sell any glass products or other products manufactured or sold by Hazel-Atlas (Op. R. 1585).

---

"DX"—defendant's exhibit
"Gov't Brief"—brief filed for the United States
"Op."—opinion of the district court

Continental was formed in 1913. In common with many American corporations it grew over the years by both internal growth and outside acquisitions.

The district court considered the evidence relating to prior acquisitions and found:

> "Many of the acquisitions were made a number of years ago in the 1920's and the 1930's. Many were extremely small. Some were the result of liquidation sales. Some appear to have been cleared with the Department of Justice or to have had its tacit approval. Some were located in Canada. Some of the companies acquired were subsequently sold.
>
> "None of the companies acquired in the ten years prior to suit were can companies. No glass company had ever been acquired before." (Op. R. 1610).

The government does not challenge these findings, and, in any event, it is clear that these ancient transactions, made by men long since dead, under different economic and legal conditions than those now prevailing, can have no relevance to the acquisition in question.

The government does present in its brief (Gov't Brief pp. 5-6) a highly distorted statement of Continental's history, concocted from material not in the record. It is, we submit, without evidentiary value.

Hazel-Atlas was a company manufacturing and selling glass containers both for home and commercial use, glassware, including tumblers, tableware and kitchenware, some types of metal closures for glass containers and miscellaneous items (Op. R. 1584). It did not manufacture or sell metal containers or any other product made or sold by Continental (Op. R. 1585).

The Proceedings Below

When the proposed acquisition was announced in the summer of 1956, the government attempted to stop it by invoking an existing consent decree to which Continental was a party.[2] When the district court which had entered that decree held that it did not apply to the proposed acquisition,[3] the government obtained the voluntary agreement of the companies to postpone the acquisition until the government could apply for a temporary restraining order. Shortly thereafter a complaint charging violation of Section 7 of the Clayton Act was filed in the District Court for the Southern District of New York, and application was made by the government for a temporary restraining order. This application was denied on September 13, 1956, and thereupon the acquisition was completed.

The action was continued as an action for divestiture. Extensive pre-trial proceedings, involving both elaborate discovery and pretrial conferences, were conducted. The case went to trial in June, 1960, almost four years after the challenged acquisition had been consummated. The government presented its case in a trial lasting six weeks, during which it called numerous witnesses, took over 4,000 pages of testimony and introduced hundreds of exhibits, among which were elaborate statistical computations. With very few exceptions everything the government offered was admitted in evidence. The government does not complain of the exclusion of the few items offered which were not admitted.

---

[2] The government erroneously identifies this decree as having been entered in *United States* v. *Hartford-Empire Co.* (Gov't Brief, p. 3 n. 2). Actually it was entered in *United States* v. *Continental Can Company*, Civil No. 26346 (N. D. Cal. 1950). Continental was not a party to the *Hartford-Empire* case.

[3] *United States* v. *Continental Can Company*, 143 F. Supp. 787 (N. D. Cal. 1956).

On the conclusion of the government's case Continental moved for a dismissal of the complaint under Rule 41(b) of the Federal Rules of Civil Procedure.

The district court, correctly applying Rule 41(b), proceeded to evaluate the evidence to determine whether on the facts presented the government was entitled to relief. Finding that it was not, the court orally announced its decision to dismiss the complaint.

This Court decided *Brown Shoe Co.* v. *United States*, 370 U. S. 294 (1962) before the district court completed the preparation of its written opinion, findings of fact and conclusions of law. Very shortly after the *Brown Shoe* decision was rendered, the government requested, and received permission to file with the district court an additional brief discussing the applicability of *Brown Shoe*. This was done and appellee responded. Judgment dismissing the complaint was entered on April 16, 1963.

The district court's opinion, reported at 217 F. Supp. 761, covers 44 printed pages. Each of the government's contentions was carefully analyzed and comprehensive findings were made with the greatest of care. Scrupulous attention was given to the teachings of *Brown Shoe* and other relevant decisions of this Court.

The district court found no fault with the legal theories advanced by the government. It based its conclusions squarely on the finding that the evidence showed no actual anti-competitive effects from the four-year old acquisition[4] and showed nothing from which it could be concluded that there was a reasonable probability that the forbidden anti-competitive effects would develop in the future. The com-

[4] By the time the complaint was dismissed, the acquisition was almost seven years old, but the trial was held four years after the event.

plaint, in short, was dismissed because the government failed to support its allegations with proof.

The Government's Brief

The government's brief attempts to plug up the gaping holes in the record that it fashioned in this case by liberal citations of alleged facts from two books (apparently graduate students' theses), neither of which was offered in evidence or subjected to the process of cross examination in the district court. The government calls these alleged facts "undisputed conclusions" reached by commentators. (Gov't Brief p. 26). The only reason they were undisputed, of course, was because the government did not see fit to expose their authors to the traditional process of cross examination.

The first of these sources relied upon by the government is a man named Hession, who wrote his doctor's thesis under the title "Competition In The Metal Food Container Industry 1916-1946". Although the government calls it the "leading work on the industry" (Gov't Brief p. 6 n. 6), it has apparently never been printed. The only copy we were able to find is in type-script.

Ironically enough, the name of Hession was on the government's witness list for the trial[5] but for reasons never explained he was not called to testify and it was therefore not possible to demonstrate in the courtroom his virulent bias against Continental. Some of it, however, shows through in his work as, for example, in his preface in which, after complaining of his difficulty in extracting information from the industry, he gives credit for cooperation to the principal competitors of Continental but

[5] Letter, dated March 8, 1960, from Robert A. Bicks, Acting Assistant Attorney General, Antitrust Division, Department of Justice, to Helmer R. Johnson (unprinted).

pointedly omits that company, the reason, obviously, being that Continental's executives had not cooperated with him as he thought they should.[6]

His statements, presented to this Court outside of the record, must be ignored if the principle of establishing facts by adversary proceeding is to continue to have meaning.

The second "witness" proffered by the government outside the record is a man named McKie who wrote his thesis under the title "Tin Cans and Tin Plate". In his work he admits to a heavy reliance on Hession, and his "facts" are no more reliable.

We are not here complaining of references to writings of recognized authorities dealing with undisputed matters of fact. We do, however, ask this Court's protection against the attempt to use unseen, palpably prejudiced writings on controversial issues as a source of "fact." (See *Reilly* v. *Pinkus*, 338 U. S. 269 (1949); *Ohio Bell Telephone Co.* v. *Public Utilities Commission*, 301 U. S. 292 (1937)).

---

[6] An example of the style of this "scholar" is found in the discussion introducing the material cited in the government's brief (Gov't Brief p. 5 n. 5); where, in describing an early president of Continental, Hession says:

> "Mr. Conway, an ex-piano salesman who had married into the family which held the controlling stock interest in Continental, had the aggressive, promoter type of personality which this ambitious program of aggrandizement required. The stock market boom of the late Twenties greatly facilitated his operations by permitting him to issue new shares of stock to a security-hungry public and thus finance the purchases."

Summary of Argument.

I.

The district court properly applied the "line of commerce" tests formulated by this Court.

The tests laid down by this Court for determining lines of commerce in which to measure the effect of an acquisition for the purposes of Section 7 of the Clayton Act are these: "The outer boundaries of a product market are determined by the reasonable interchangeability of use or the cross-elasticity of demand between the product itself and substitutes for it." There may be submarkets within an outer market, depending on such "practical indicia" as "industry or public recognition of the submarket as a separate economic entity, the product's peculiar characteristics and uses, unique production facilities, distinct customers, distinct prices, sensitivity to price changes, and specialized vendors." (*Brown Shoe Co.* v. *United States*, 370 U. S. 294, 325 (1962)).

The fact that it may be technically possible to use a product for more than one purpose does not, standing alone, satisfy any of these tests.

In actual usage, for products other than beer, there is neither reasonable interchangeability nor cross-elasticity of demand between glass containers and metal containers. Products tend to move predominantly in one type of container or the other, depending on price, physical characteristics of the product, tradition, packing processes, type of market and many other factors.

Applying the market definition tests laid down by this Court, the district court found an interindustry line of commerce consisting of both glass and metal containers

for beer, and, at the same time, found no line of commerce consisting of glass and metal containers generally, or of glass and metal containers for the canning of food. The district court's findings negating the existence of these two claimed lines of commerce are supported by an overwhelming body of evidence, and are clearly correct.

II.

The district court was correct in finding that there was no evidence of reasonable probability of anti-competitive effects resulting from the acquisition.

The effect of an acquisition on competition must be measured in terms of reasonable probability, and the district court found no reasonable probability of anti-competitive effects from the acquisition of Hazel-Atlas by Continental. This finding was clearly correct. The government offered no evidence of probable anti-competitive effect and the record contains none.

III.

The government's statistics are unreliable and provide no basis for measuring shares of any market.

The statistics which the government uses in an attempt to show the market participation of companies selling containers for use in food canning are demonstrably false. They themselves demonstrate that it is impossible to combine figures for two dissimilar markets and come out with any meaningful result.

ARGUMENT.

I.

The district court properly applied the "line of commerce" tests formulated by this Court.

The threshold question in any Section 7 case is the delineation of the relevant market or line of commerce—"a necessary predicate to a finding of a violation of the Clayton Act." (*United States* v. *E. I. duPont de Nemours & Co.*, 353 U. S. 586, 593 (1957)). In the court below, the government claimed that there were ten pertinent lines of commerce.[7] In this Court, the government has abandoned nine of the ten and come up with an eleventh. The new one is what it denominates "the production and sale of containers used for all purposes for which metal or glass containers may be used"[8] (Point I of the government's brief). The only one of the original ten claimed lines of commerce which the government is seeking to defend is "containers for the food canning industry" (Point II of the government's brief).

The fact that the government never asserted its eleventh line of commerce in the district court should be enough for this Court to refuse to consider the government's principal argument on this appeal (Point I). Section 7 cases, after

---

[7] 1. Containers for the canning industry. 2. Containers for the beer industry. 3. Containers for the soft drink industry. 4. Containers for the toiletries and cosmetics industry. 5. Containers for the medicine and health industry. 6. Containers for the household and chemical industry. 7. The can industry. 8. The glass container industry. 9. Metal closures. 10. The packaging industry.

[8] Gov't Brief p. 18.

all, are essentially factual inquiries, and this Court does not try them *de novo*. In any event, the government's argument is demonstrably without merit.

The government calls attention (Gov't Brief p. 15) to the statement in *United States* v. *United Shoe Machinery Corp.*, 110 F. Supp. 295, 303 (D. Mass. 1953), *aff'd per curiam*, 347 U. S. 521 (1954) that "the problem of defining a market turns on discovering patterns of trade which are followed in practice." We agree with that statement and so did the district court, for that is exactly the approach taken by it. The government's only complaint is that it doesn't like what the district court discovered.

The government seeks to create the impression that this case raises the question of whether Section 7 is applicable to "interindustry" mergers. No such issue is presented here.

It has never been contended in this case that Section 7 is not applicable to interindustry mergers if the tests laid down by this Court for determining a line of commerce are met and the effects prohibited by the statute are found.

The district court clearly recognized that. It did not dismiss the complaint on any theory that interindustry mergers are necessarily lawful. It dismissed because of failure of proof that this particular interindustry merger was unlawful.

Any contention that the district court was laboring under a misconception on this score is clearly negated by the court's treatment of the government's beer container line of commerce. The court specifically found that there was *prima facie* evidence warranting the inclusion in a single line of commerce of metal and glass containers for beer, even though the containers were products of different industries. This finding was made because, in the

judgment of the district court, the evidence as to beer containers satisfied the market definition tests laid down by this Court (see *infra*, p. 17).[9] But, applying the same tests, the district court found that the other interindustry lines of commerce advanced by the government were not sustained by proof. In short, the law was applied by the court below to the facts of record. That the findings of fact were not to the government's liking does not mean that the court misconceived the law. Nor does it mean that this Court should try factual issues *de novo*. "It ought to be unnecessary to say that Rule 52 applies to appeals by the Government as well as to those by other litigants." (*United States* v. *Yellow Cab Co.*, 338 U. S. 338, 341 (1949). See also, e.g., *United States* v. *Oregon State Medical Society*, 343 U. S. 326, 331-32, 339 (1952)). As Mr. Justice Douglas said in *United States* v. *National Association of Real Estate Boards*, 339 U. S. 485, 496 (1950): "... our mandate is not to set aside findings of fact 'unless clearly erroneous.'"

The test for determining a relevant market for Clayton Act purposes, as formulated by this Court in *duPont-General Motors*,[10] is whether products possess "sufficient peculiar characteristics and uses to constitute them sufficiently distinct" from one another to make them separate lines of commerce.

---

[9] The government misstates the position of the district court when it says that it was that court's view that "physically dissimilar products cannot usually be in the same relevant market for antitrust purposes" (Gov't Brief p. 38 n. 38). That this was not the view of the district court is shown by its holding that physically dissimilar bottles for beer and metal containers for beer were in the same line of commerce.

[10] *United States* v. *E. I. duPont de Nemours & Co.*, 353 U. S. 586, 593-94 (1957).

The formulation of this rule was foreshadowed in earlier cases. In *Times-Picayune*,[11] a Sherman Act case, the Court said:

> "For every product, substitutes exist. But a relevant market cannot meaningfully encompass that infinite range. The circle must be drawn narrowly to exclude any other product to which, within reasonable variations in price, only a limited number of buyers will turn; in technical terms, products whose 'cross-elasticities of demand' are small. Useful to that determination is, among other things, the trade's own characterization of the products involved."

The same principle was applied a few years later in the *Cellophane* case:[12]

> "Determination of the competitive market for commodities depends on how different from one another are the offered commodities in character or use, how far buyers will go to substitute one commodity for another. For example, one can think of building materials as in commodity competition but one could hardly say that brick competed with steel or wood or cement or stone in the meaning of Sherman Act litigation; the products are too different. This is the interindustry competition empha-

[11] *Times-Picayune Publishing Co.* v. *United States*, 345 U. S. 594, 612 n. 31 (1953). Cf. Hale and Hale, *Market Power: Size and Shape Under the Sherman Act* (1958), frequently cited by the government in its brief (Gov't Brief p. 16 n. 14, p. 17 n. 17, p. 20, n. 19, p. 38 n. 37), at 284:

> "In the last analysis, substitution is a question of degree, since almost every service or product competes against every other. It has often been remarked, for example, that consumers have preferred to buy new automobiles rather than improve their housing conditions."

[12] *United States* v. *E. I. duPont de Nemours & Co.*, 351 U. S. 377, 393 (1956).

> sized by some economists. See Lilienthal, Big Business, c. 3."

One year after *Cellophane* the issue of market definition reached this Court in an antimerger action under original Section 7 of the Clayton Act in *duPont-General Motors*.[13] It was there that the Court articulated as the governing criterion the "peculiar characteristics and uses" test, which is essentially a verbal variation of *Cellophane's* doctrine of reasonable interchangeability:

> "The record shows that automotive finishes and fabrics have sufficient peculiar characteristics and uses to constitute them products sufficiently distinct from all other finishes and fabrics to make them a 'line of commerce' within the meaning of the Clayton Act."[14]

The rule was next applied by this Court in *International Boxing*.[15] There the district court had held that the defendants had monopolized trade in championship boxing contests in violation of Section 2 of the Sherman Act, rejecting their defense that the appropriate market consisted of the entire entertainment field or at the very least the promotion of all boxing contests. In this connection, the district court had found that a particular and special demand existed for championship bouts in contradistinction to the non-championship variety and other sporting events, public shows, spectacles and entertainment. This Court affirmed, holding that the trier of facts was warranted in concluding that championship boxing was not reasonably interchangeable for the same purposes with non-championship contests

[14] Id. at 593-94.

[15] *International Boxing Club* v. *United States*, 358 U. S. 242 (1959).

(and, *a fortiori* with other forms of entertainment)—price, use and qualities considered. That the market would have been the same in a Section 7 case is abundantly apparent from this Court's further observation,[16] citing *duPont-General Motors*, that by analogy championship boxing "bears those sufficiently 'peculiar characteristics' found in automobile fabrics and finishes such as to bring them within the Clayton Act's 'line of commerce.'"

The standards of *Times-Picayune, Cellophane, duPont-General Motors* and *International Boxing* were synthesized in *Brown Shoe*.[17] Here this Court considered both the outer boundaries of a product market and the submarkets within the broad market. With respect to the former it said:

> "The outer boundaries of a product market are determined by the reasonable interchangeability of use or the cross-elasticity of demand between the product itself and substitutes for it."[18]

It then went on to indicate some of the "practical indicia" for determining submarkets, listing

> "... industry or public recognition of the submarket as a separate economic entity, the product's peculiar characteristics and uses, unique production facilities,

[16] Id. at 252 n. 8.

[17] *Brown Shoe Co. v. United States*, 370 U. S. 294 (1962). In this case there was no discussion, for example, as to whether canvas footwear should be included in the line of commerce. Notwithstanding the fact known to everyone that canvas footwear may sometimes serve as a substitute for leather footwear, the former was without discussion excluded from the product market in which wearing apparel shoes were under consideration. Id. at 300 n. 4.

[18] Id. at 325.

distinct customers, distinct prices, sensitivity to price changes, and specialized vendors."[19]

In defining the pertinent lines of commerce in this case, the district court scrupulously applied the tests established by the decisions of this Court and made detailed findings of fact fully supporting its market definitions.

Each of the ten lines of commerce originally proposed by the government was considered in minute detail by the district court. It found that only three of them—glass containers, metal cans, and containers for beer—did, in fact, constitute separate lines of commerce.

---

[19] Id. at 325. The consistent application of the rule was continued in *United States* v. *Philadelphia National Bank*, 374 U. S. 321, 356-57 (1963), which was decided after judgment was entered in the district court in this case.

It is of more than passing interest to note the government's espousal of the "characteristics and uses" test in its brief in *United States* v. *Aluminum Company of America and Rome Cable Corporation*, Docket No. 204, this Term. In its brief it argues:

> "Aluminum and copper wire and cable are made of metals having entirely different physical and electrical properties and wholly unrelated supply and price patterns * * *. These factors determine the electrical uses to which the metals can be put. By virtue of their peculiar properties, aluminum and copper conductors have developed distinctive end uses —aluminum, both bare and insulated, as an overhead conductor, and copper as an insulated conductor for underground, indoor and other enclosed wiring, applications in which aluminum's brittleness and larger size render it impractical * * *. In overhead transmission and distribution, fields in which aluminum is physically interchangeable with copper, the price differential between the two metals dictates the use of aluminum. And, as we have noted, there is no responsiveness between the price of aluminum conductor and that of copper conductor. It is only in a most restricted sense, then, that aluminum and copper compete with one another as electrical conductors. It follows that aluminum conductor, like aluminum insulated, is an appropriate 'line of commerce' in which to appraise the effect of the merger on the structure of competition." (Brief for Appellant, pp. 47-48, *United States* v. *Aluminum Company of America and Rome Cable Corporation*, Docket No. 204, this Term).

As noted above, that the district court clearly understood and properly applied the criteria specified by this Court for determining lines of commerce and appraising competition between products, whether in the same industries or in different ones, is demonstrated by its findings with respect to beer containers. Here the district court evaluated the evidence and found that a *prima facie* showing had been made that glass containers for beer and metal containers for beer constituted a single line of commerce notwithstanding the fact that they were made and sold by different industries. This finding was based on evidence which the district court considered to show "virtual interchangeability of use and cross-elasticity of demand between the two types of containers used for this purpose" [i.e., beer] (Op. R. 1629). Having found such a line of commerce, the district court proceeded to evaluate the effect of the acquisition in it and found no reasonable probability that the acquisition would adversely affect competition in that line of commerce (Op. R. 1631-33). The district court's opinion plainly shows that the same methodology was followed with respect to every other line of commerce claimed by the government, including its alleged "interindustry" lines, and, specifically, metal cans for food and glass containers for food.

The evidence on the question of whether metal cans and glass containers can be forced into the same product market can best be summarized in terms of the "practical indicia" referred to in *Brown Shoe*.[20]

Industry and public recognition

The can industry and the glass container industry are separate and well defined. Each has its own trade association and the Bureau of Census collects statistics

[20] 370 U. S. at 325.

relating to them separately (R. 419, 903; GX 800, R. 2867-84, 1490; GX 801, R. 2962-66, 1489). The business world and the public recognizes them as separate industries and markets. There are no combined statistics available (R. 1281).

The product's peculiar characteristics and uses

Cans and glass containers are made of different materials and have different physical characteristics (Op. R. 1586, 1588). While in some instances it may be physically possible to package products in either type of container, other forces, including tradition, weight, price, attractiveness and many others determine which container is customarily used (Tr. 665, unprinted, R. 452, 472, 957-58). This was graphically demonstrated by the estimates of the government's own expert (R. 900-01, 951-53, 954-55; DX-N, R. 3389-92, 935).

Unique production facilities

Can and glass container manufacturing equipment is not interchangeable (DX-K, R. 2478, 3389, 569). From the user's point of view it is not feasible to use a canning line designed for packing a product in cans to pack a product in glass containers or vice versa (R. 306, 467-68, 476-78).

Distinct customers

There was no evidence to show that purchasers of metal cans or glass containers, or both, fall into any categories of distinct classes of customers (Op. R. 1643). The purchasers do not pack the same product in different containers (DX-N, R. 3389-92, 935).

Distinct prices

Glass containers and cans are priced separately. The prices of cans are determined principally by the price of tinplate; those of glass containers principally by the cost of labor (R. 146, 167-68, 410-11). Glass

and can manufacturers do not equalize freight with containers of a type which they do not manufacture (Tr. 233, unprinted, R. 58, 146, 169, 185, 281). Glass and can manufacturers do not reduce their regularly quoted prices to meet the lower price of containers of a type which they do not manufacture (Tr. 247, unprinted, R. 146, 185, 281, 384, 394).

Sensitivity to price changes

Prices of one type of container (except, perhaps, beer containers—Op. R. 1629) are not changed in response to price movements of the other type (R. 146, 185, 281, 384, 394). Manufacturers of one type of container frequently do not even know the price at which the other type of container is being sold (R. 384, 394). Buyers do not shift their purchases from one type of container to the other because of changes in the price differential between the two. (See, *e.g.*, quotations *infra*, pp. 20-22).

Specialized vendors

Can manufacturing companies sell cans and glass container companies sell glass containers. Sales are normally made directly to users (R. 383-84). The evidence gives no hint of the existence of jobbers or wholesalers who sell both cans and glass containers, and the reason, of course, is that such persons could not be found.

Against this evidence the government still contends that cans and glass containers are somehow in the same product market. In support of this contention it says that the two types of containers are "functionally interchangeable" (Gov't Brief p. 26). By this it apparently means that it is sometimes physically possible to use the two types of containers for the same end purposes. This argument deliberately avoids consideration of all of the characteristics of

each type of container which make impractical or uneconomical their interchangeability in actual usage. The argument gives no recognition to the realities of the market place.

A test of substitutability in terms of "functional interchangeability" is not and cannot be the same as a market test based on *reasonable* interchangeability or cross-elasticity of demand. Products may be functionally interchangeable when it is unimaginable that they could be so economically or practicably interchangeable as to reflect cross-elasticity of demand. Many instances immediately come to mind. Gold, for example, will perform many of the same functions that steel will and so is functionally interchangeable, but there is no market cross-elasticity between the two. Silver can often be substituted for copper in electrical installations, and actually was so substituted in some instances during the war. Yet under normal market conditions there is no market cross-elasticity between the two. In order to evaluate market cross-elasticity, examination must be made of economic limitations; market factors, such as consumer acceptance and tradition; practical limitations; and actual usage.

The market studies on which the government relies, so far from proving that the two types of containers are interchangeable, demonstrate how separate they really are. Consider some of the conclusions of these studies:

> "It takes many varied attributes to make a good container material. Each container material excels in certain attributes. Each has certain products for which it is the best adapted container material." (GX 33, R. 1744, 950).

> "The closure cost of the jar makes the glass package more expensive for Processed Foods." (GX 400A, R. 2531, 722).

"Our Baby Food can prices as compared to glass would seem to offer sufficient attraction to the packer to use tin, but here the consumer preference for glass controls the package used and the packer is somewhat indifferent because his price in glass more than compensates for the increased cost of that package. This probably will not change until the housewife becames more price conscious." (GX 400A, R. 2532, 722).

"Vacuum Packed Coffee—While the cost to the packer of the glass container is less, apparently packer, distributor, and consumer preference for tin outweighs this price consideration." (GX 400A, R. 2532, 722).

"The price of the container to the packager is not a dominant factor in the selection of either glass or metal. In the small sizes, metal cans are competitive costwise, but currently lack consumer acceptance. In the large size market the glass jar has, up until the present, been unsuccessful in making any significant inroads at prevailing price ratios to metal. It, therefore, follows that a price reduction on metal cans in the 5 or 10 pound sizes would not result in any additional business. Likewise, price reduction alone on the smaller 1½ or 2½ pound capacity cans would probably not result in any additional business." (GX 401, R. 2543, 1542).

"Under these circumstances, it appears unlikely that the mere offering of a new metal container to the widely scattered peanut butter industry would produce rewarding results, particularly in view of the industry's present dollar and market investment in glass containers and their filling and closing equipment." (GX 402, R. 2551, 847).

"In spite of the price advantage of glass, the majority of coffee roasters are anxious to use cans to as high a percentage as possible." (GX 406, R. 2579, 1543).

"The outstanding and major reasons for consumers preferring glass jars instead of metal cans for baby food is the deep seated belief that jars are completely sanitary containers which can be used in place of dishes for feeding and are also ideal for storing unused portions of food in a refrigerator while conventional cans are not suitable for either direct feeding use or storage of partial contents." (GX 417, R. 2632, 821).

"We do know there is a decided demand for non-returnable packages and this situation may influence the industry to accept smaller profit margins in order to meet consumer preferences." (GX 435, R. 2703, 628).

The district court properly found as a fact that the material relied on by the government did not show reasonable interchangeability or cross-elasticity of demand as between metal cans and glass containers generally (Op. R. 1642-43).

But there is a further infirmity inherent in the government's effort to delineate a line of commerce comprising "containers used for all purposes for which metal or glass containers may be used." If, contrary to the findings below, metal and glass containers are deemed to be reasonably interchangeable and to possess the requisite cross-elasticity of demand, there is no rational basis for stopping there. Any "overall line of commerce"[21] must also include, besides metal and glass, such other materials as paper, plastic and foil. Indeed, *the government concedes that "this overall line of commerce includes competition for the same end uses by other containers, such as paper, plastic and foil."*[22] The

---

[21] Gov't Brief p. 18 n. 18.

[22] *Ibid.* (Emphasis added).

fact that "the further competition of such other industries prevents expression in market share percentages of the impact of this merger"[23] is no excuse for arbitrarily excluding these materials from the alleged line of commerce. As the government itself acknowledges, "the touchstone" to the problem of market definition is finding "'the area of effective competition'" (Gov't Brief p. 15). If glass and metal containers can be thrown into the same general inter-industry line of commerce, there is no warrant for excluding the other materials which equally belong there.

Referring to the *Cellophane* case, the government says: "Just as cellophane and Pliofilm were regarded in *duPont* to be competing packaging materials for meat packers and other packaging customers (351 U. S. at 399-400), so are glass and metal containers in competition in this case for the business of all users of such containers." (Gov't Brief p. 39). In making this statement, the government exposes the fundamental weakness of its position. This Court in *Cellophane* did *not* confine the relevant market to cellophane and Pliofilm; it held that the market consisted of *all* reasonably interchangeable flexible packaging materials—cellophane and Pliofilm being only two.

The government never claimed in the court below that glass and metal containers alone constituted a distinct product market, but included them in a general "packaging industry" line of commerce. This was the government's overall interindustry line, and it was never seriously pressed in the district court. It was rejected by the trier of facts, who said: ". . . there was complete failure of proof" (Op. R. 1618), and the government is not appealing from that determination. Its belated effort now to slice just two segments out of this multi-segment pie is an act of

[23] *Ibid.*

sheer expediency without a semblance of support in the record. By this maneuver it would brush aside all of the huge businesses selling substitute products and escape the embarrassment of dealing with paper milk containers; cracker boxes, breakfast food containers, frozen food paper boxes, composite oil cans and anything else that does not happen to fit within its neatly gerrymandered line of commerce.

To support its arguments with respect to this newly discovered line of commerce, the government leaps clear of the record in the case and announces (Gov't Brief p. 26):

> "As reflected in the *literature* on the metal and glass container industries, the two containers are functionally interchangeable and present alternatives to packers whose competitive choice between them has varied with the commodity to be packed, their comparative cost and other characteristics which affect the desirability of each." (Emphasis added).

For this proposition, it cites a series of obscure publications and several newspaper articles (Gov't Brief p. 26 n. 25). It bolsters its argument with a pronouncement from the elusive Hession, whom it did not dare expose to cross examination, that:

> "Competition which in the past had been merely potential became active and aggressive." (Gov't Brief p. 27).[24]

It also cites a statement made a quarter of a century ago, under unknown circumstances and in an unknown context,

---

[24] For what it is worth, we quote the other of the government's favorite outside-the-record "witnesses" who, in discussing cans and glass containers, says flatly:

> "There is no one 'container market'. The markets are heterogeneous." McKie, *Tin Cans and Tin Plate* (1959) p. 295.

by a supplier of tinplate to the effect that in arriving at prices for tinplate:

> "other types of containers [kind unspecified] . . . always come into our discussions." (Gov't Brief p. 27).

Squarely opposed to this argument are the findings of the district court which, after commenting on the paucity of the testimony relating to interchangeability, found (Op. R. 1642-43):

> "It can scarcely be said that this testimony shows any general interchangeability of use or cross-elasticity of demand as between glass and cans. The fact that *in some instances* similar products were packaged in two or more different types of containers, or that at times one kind of container has supplanted another in the packaging of the same product, does not show that different types of containers are *generally* commercially interchangeable.
>
> "Choice of type of container in which to pack a particular product may be dictated by a variety of factors, including traditional or changing preferences of the buying public, eye appeal, the nature of the trade to be served, the physical characteristics of the product to be packed, the type of packing process required, distance to outlets, and other diverse factors. But the record is barren as to the extent to which specific factors of this nature affect the choice of metal or glass containers in which to pack the enormous varieties and kinds of food products included within the broad range claimed for this product market."[25] (Emphasis added).

[25] Many of the exhibits which the government cites to support its interchangeability theory refer to beer, with respect to which product, of course, the district court found that metal containers and glass containers did constitute a line of commerce. The government admits (Gov't Brief p. 30 n. 29) that Hazel-Atlas was not a significant factor in beer bottle production. The government's

The government's own expert witness presented evidence which the government admits (Gov't Brief p. 28) showed that "particular products may be packed predominantly in one of these containers, to the almost total exclusion of the other." The government would dismiss this evidence as overlooking "the dynamic nature of the competition between these two industries" (Gov't Brief p. 28).

The evidence in question was a comprehensive survey of how various products are packed, of how they actually move in commerce. This evidence cannot be dismissed lightly; it is the proof of actual usage, in contradistinction to all of the government's fine theories of mere possibility of usage. Here is what the government's expert found (DX-N, R, 3389-92, 955):

Ammonia	All or substantially all in glass.
Antiseptics	All or substantially all in glass in consumer size.
Baby Foods	80% glass; 20% cans.
Beer and ale	39% cans; 6½% non-returnable glass; balance returnable glass.
Brilliantines	All or substantially all in glass in liquid form and some collapsible tubes with different formulation.
Catsup	All or substantially all in glass in consumer size—Institutional all or substantially all in cans—plastic film or containers for individual servings—very small.
Cheese spreads	90% glass; balance aluminum tumblers, plastic tubes and film, collapsible metal tubes, foil, crocks and paper; no cans.
Chili sauce	All or substantially all in glass.
Cider	All or substantially all in glass.

---

statement (Gov't Brief p. 29) that the development of the beer can prompted the production of cheaper and lighter weight non-returnable bottles is not supported in the record. It is obvious that important factors in this development were the reluctance of supermarkets to handle returnable bottles and the glass container industry's desire to sell twenty or more bottles where previously only one had been sold.

Citrus segments, chilled	All or substantially all in glass.
Citrus segments, non-refrigerated	95-100% cans.
Coffee, ground	Less than 1% in glass; balance in cans and paper bags.
Coffee, soluble	99% glass; 1% cans.
Cologne	95-100% glass — some aerosols of glass, metal and plastic.
Corn	All or substantially all in cans.
Corned beef hash	95% cans.
Cosmetic creams	90% glass; 5% plastic; 5% collapsible tubes.
Crabmeat	All or substantially all in cans.
Cranberry sauce	All or substantially all in cans.
Cream, whole	50% glass; 50% paper—no cans.
Cured ham	All or substantially all in cans.
Distilled spirits	All or substantially all in glass.
Drugs, ethical in liquid form	All or substantially all in glass.
Flavoring extracts	All or substantially all in glass.
Food sauces other than tomato sauce	All or substantially all in glass.
Fruit spreads and preserves	More than 95% in glass for home consumption.
Green beans	95% cans; 5% glass.
Hair lacquer	All or substantially all in metal.
Hair tonic	More than 95% in glass.
Hominy	All or substantially all in cans.
Horse radish	All or substantially all in glass.
Juices, concentrated and frozen	All or substantially all in cans.
Lard	All or substantially all in cans; a little paper.
Lighter fluid	90% cans—10% glass.
Lima beans	All or substantially all in cans.
Liquid bleach	All or substantially all in glass.
Liquid shoe polish	All or substantially all in glass.
Lubricating grease	All or substantially all in cans.
Luncheon meat	All or substantially all in cans.
Machine oil	Substantially all in cans.
Marachino cherries	All or substantially all in glass in consumer size.
Mayonnaise	All or substantially all in glass in consumer size.
Milk, whole	55% paper—45% glass.

Mineral oil	All or substantially all in glass.
Motor oil	All or substantially all in cans.
Mouth wash	All or substantially all in glass.
Mustard, prepared (consumer size)	95% glass—5% plastics.
Nail polish	All or substantially all in glass.
Nail polish remover	All or substantially all in glass.
Olives, green	All or substantially all in glass.
Olives, ripe	90-95% cans; balance glass.
Paint, oil base (household, interior and exterior)	None in glass.
Paint, polyvinyl acetate base (household, interior and exterior)	None in glass.
Paint, rubber base (household, interior and exterior)	None in glass.
Paste shoe polish	All or substantially all in cans.
Peaches	95% cans—5% glass.
Peanut butter (consumer size)	90% glass—5% plastic and 5% cans.
Pears	95% cans—5% glass.
Peas	All or substantially all in cans.
Perfume	All or substantially all in glass.
Pickles	Over 95% glass for household use—balance between cans and plastic film.
Pineapple	All or substantially all in cans.
Proprietary medicine in liquid form	95% glass—5% plastics.
Prune juice	All or substantially all in glass.
Pumpkin	All or substantially all in cans.
Relish (consumer size)	All or substantially all in glass.
Salad and cooking oils (consumer size)	85% glass; 15% cans.
Salad dressings	100% glass for retail.
Salmon	All or substantially all in cans.
Sardines	All or substantially all in cans.
Single strength blended orange and grapefruit juice	Over 95% cans.
Single strength grape fruit juice	90-95% cans; balance glass.
Soft drinks	98½% glass; balance cans (1% is one way bottle).
Solid and semi-solid shortening	All or substantially all in cans.

Soup (Liquid form)	All or substantially all in cans.
Squash	All or substantially all in cans.
Starch (Liquid form)	All or substantially all in glass.
Sweet Potatoes	All or substantially all in cans.
Syrup, chocolate	95% cans—5% glass.
Toilet water	All or substantially all in glass.
Tomato juice	Over 95% in cans.
Tomato paste	All or substantially all in cans.
Tomato puree	All or substantially all in cans.
Tomato sauce	All or substantially all in cans.
Tomatoes, stewed	All or substantially all in cans.
Tomatoes, whole	All or substantially all in cans.
Tuna fish	All or substantially all in cans.
Vinegar	All or substantially all in glass consumer size.
Wax beans	Over 95% cans—balance glass.
Wet pack pet foods	90-95% cans; balance glass.
Wine	All or substantially all in glass.
Writing ink	All or substantially all in glass except refill cartridges.

Far from overlooking anything, this is proof of how containers are actually used in the market place with all of its dynamism.

We call to the Court's attention that the plaintiff here is the United States, represented by the Department of Justice, and that it makes diametrically opposite arguments as expediency dictates.

On December 4, 1956, about three months after the action in this case was instituted, a complaint was filed by the government in the Northern District of Ohio attacking the acquisition of National Container Corporation by Owens-Illinois Glass Company as a violation of Section 7.[26] In that action the government made strenuous efforts to limit the line of commerce to glass containers. Toward that end, it served the following requests to admit, among others, on Owens-Illinois:

[26] *United States v. Owens-Illinois Glass Company*, Civil No. 7686 (N. D. Ohio).

"(23) While certain other materials may possess one or more of the characteristics of glass for container purposes, no other material possesses all of the qualities possessed by glass for container purposes."

"(54) Glass containers are recognized in the industry as being a product having peculiar and unique physical characteristics which distinguish them from containers made from other materials."

"(55) Glass containers are recognized in the industry as being a product having peculiar and unique utilization characteristics which distinguish them from containers made from other materials."

"(58) Although there are a number of products packaged both in glass containers and in containers made from other materials, there exists no substitute for glass containers which possess all of the several physical and utilization characteristics possessed by glass containers."

In a subsequent answer to a counter request to admit, the government stated:

"... *many, if not most, container uses require particular combinations of characteristics* (e. g., impermeability—rigidity—transparency) *not found in containers made of materials other than glass.*" (Emphasis added).

The government made a motion for summary judgment in the *Owens-Illinois* case. In its briefs in support of its motion, filed only about two years ago, it recognized that glass containers could not be combined with other containers to form a line of commerce. It told the district court in that case:[27]

[27] Brief for Plaintiff, p. 33, Reply Brief for Plaintiff, p. 43, *United States* v. *Owens-Illinois Glass Company*, Civil No. 7686 (N. D. Ohio).

"A number of products are packaged both in glass and in containers made from other materials. For specific customer demands which require particular combinations of characteristics possessed by glass containers, however, there is no substitute for glass containers."

"Defendant's [i.e. Owens-Illinois'] insistence on a glass-paper-tin-plastic 'consumer container' line of commerce without permitting recognition of what business and the public at large recognize as distinct products would, if adopted, emasculate the broad purposes of Congress in enacting Section 7."

We submit that facts are facts, and that the definition of lines of commerce should be made by the tests prescribed by this Court, not varied according to the theories of the government in its various cases. The lack of substitutability to which the government referred in the *Owens-Illinois* case was found to be a fact by the district court in the instant case.

That brings us to the government's proposed "food canning" line of commerce. When the government proposed this line of commerce prior to trial, it defined it as relating to containers for heat-sterilized and hermetically sealed foods. At the trial it limited this line to hermetically sealed foods, although some of the foods it claimed fell within this line were heat-sterilized but not hermetically sealed, some were hermetically sealed but not heat-sterilized, and some were neither. (See Op. R. 1639-40).

The government's confusion as to what it means to include within its "canning" line is complete. In its Pretrial Statement of proposed "Steps of Proof" it defined it as ". . . fruits, vegetables, juices and other foods which are heat-sterilized and hermetically sealed in cans and glass containers."

In oral argument on the motion to dismiss counsel for the government said (Tr. 4101, unprinted): ". . . when we attempted to define this in our answer to interrogatories, we attempted to define it in this manner, to explain what we were talking about and what we were trying to exclude, and the key thing is we were trying to include things which are hermetically sealed. *We used the words 'heat sterilization' because we are trying to get away from frozen food.*" (Emphasis added). In response to questions from the district court, government counsel said that candy and baking powder in screw top containers (i.e., containers which are not hermetically sealed) would be included. The district court then said (Tr. 4109, unprinted):

> "The Court: In other words, your contention now—I want to make sure I get this—your contention at the present time is that your line of commerce on food includes all foods that are packaged in tin or glass."

To this government counsel replied (*ibid.*):

> "That would be correct."

In an affidavit in support of a motion for reargument made just after the trial, government counsel said:

> ". . . our definition of the canning line included products which were not heat sterilized and in essence represented all foods which were put in hermetic containers." (McManus affidavit, December 21, 1960, p. 3, unprinted).

In the same affidavit (p. 5) government counsel said:

> "By its [the government's] direct examinations and by its documentary evidence it left no doubt that the 'canning' line included non-heat sterilized foods."

The district court dealt with this confusion in its opinion. (See Op. R. 1639-40).

On this appeal the government has reversed its position again, and it now would limit the line to foods which are both hermetically sealed and heat-sterilized (Gov't Brief pp. 13-14, 41).

The government now contends that one physical fact alone—the possibility of creating a hermetic seal on a container which can be heat-sterilized—is sufficient to create a line of commerce. It would ignore all other market factors which were shown at the trial to negative completely the existence of a line of commerce consisting of containers for canning.

A line of commerce consisting of containers for hermetically sealed and heat-sterilized foods is not known in everyday use and the evidence does not permit one to be discovered. The government's two experts did not recognize such a line. The government's food expert testified that food processing for glass packing was different from that for metal can packing; that packing techniques for different types of containers were different; that packing economies were different; that the equipment required was different; and that the physical characteristics of the two types of containers produced different packing results (R. 297-300, 305-07, 308-09). The government's other expert testified that specified products tend to move in containers of one type or the other but not in both (R. 951-53, 954-55; DX-N, R. 3389-92, 955).

In its brief (Gov't Brief p. 28) the government says that in the district court it produced the "most graphic evidence of the interchangeability of glass and metal containers—the fact that numerous products are packed in both types of containers." "Investigators", it says, "observed a great variety of goods being offered for sale *competitively*

at retail stores throughout the country in both glass and metal containers." (Emphasis added).

The reference is to certain products purchased by FBI agents in retail stores. So far from showing that the products were offered for sale "competitively", it was stipulated at the trial (R. 1160-61) that no attempt had been made to determine if the products were offered competitively. They are not the same products; they are not processed in the same way; and they are not priced competitively. A copy of the stipulation is annexed as Appellee's Appendix.

An examination of the examples of food products packed in both types of containers generally shows immediately what the differences were: green olives were packed in glass —ripe olives in cans; fruit preserves packed domestically were packed in glass containers—fruit preserves packed abroad and imported were packed in cans; tomato catsup in retail sizes was packed in glass containers—tomato catsup in institutional sizes was packed in cans.

In rejecting the government's food canning line of commerce, the district court specifically found, after an exhaustive review of the evidence, that there was "no showing of reasonable interchangeability of use or cross-elasticity of demand as between metal and glass containers used for packing food" (Op. R. 1641); that there was "no showing of any public or industry recognition of such a product market or submarket" (Op. R. 1640-41); that metal cans and glass containers do not have the same physical characteristics and uses in the food field (Op. R. 1641); that "their shapes, sizes and other characteristics differ widely, depending upon the type of food to be packed in them" (*ibid.*); that "the manufacturing equipment and processes and the raw materials for each, far from being interchangeable, are entirely different" (Op. R. 1643); that "the

machinery used to pack food products in glass containers and the packing process are different from that used for packing in metal cans" (*ibid.*); that "there was no evidence to show that the thousands of packers of food products who purchase metal cans or glass containers, or both, fall into any categories of distinct classes of customers" (*ibid.*); that there was no evidence of "a distinct price structure for metal cans and glass containers used for food products, or of correlation or correspondence of prices between them" (*ibid.*); and that "there are no specialized vendors of containers used for food products" (*ibid.*).

The district court, in short, went down the line of product market indicia outlined by this Court in *Brown Shoe*, and found the government's case deficient on each and every score. The government makes no showing that these findings were incorrect, much less clearly erroneous (Fed. R. Civ. P. 52(a)). It simply wants this Court to make its own *de novo* findings on the basis of the government's *ipse dixit*.

In addition to the detailed and comprehensive findings negating the government's canning line of commerce, the record shows that although Hazel-Atlas and Continental both sold their respective containers for food, they sold them for different uses.

The principal glass containers manufactured and sold by Hazel-Atlas for use as food containers were for use in packaging catsup, chili sauce, vinegar, syrup, salad dressing, jams, preserves, pickles, mayonnaise, maraschino cherries, olives and mustard (R. 359-60).

These products do not move in metal cans, except that a small amount of certain types of syrup is in cans. Catsup, chili sauce, salad dressing and mayonnaise in retail sizes are practically unknown in containers other than glass. The same is true of the other principal foods for which

Hazel-Atlas sold glass containers—vinegar, jams, preserves, pickles, maraschino cherries and mustard (DX-N, R. 3389-92, 955). Baby food containers, to which the government refers (Gov't Brief p. 45), was a use for which Hazel-Atlas's participation was negligible (R. 339), as the government admits (Gov't Brief p. 45 n. 46).

On the other side, the principal food products for which Continental sells its metal cans do not move in glass containers. Continental's largest food container lines are for fruits and vegetables, including juices (GX 800, R. 2887-88, 1490). Much of the fruit juice is packed concentrated in frozen form for which glass containers are not suitable. With respect to fruits and vegetables generally, cooking time, weight, appearance and other market factors militate so heavily against glass containers that in practice only small amounts of premium grades are packed in glass containers (R. 298-300, 470-71, 477-78; GX 317, R. 2337-81, 69; GX 318, R. 2382-2439, 71). In total, these are negligible (DX-N, R. 3389-92, 955).

Other major food products for which Continental sells metal cans are evaporated milk, fish and seafood, coffee, meat and lard and shortening (GX 800, R. 2887-94, 1490). Here also, for a host of different reasons, some applying to one product and some to another, these products are, and continue to be, packaged in cans. Sometimes it is weight, often it is appearance and very frequently it is the very nature of the processing to which the product is subjected which determines that a metal container is the only practicable container to use.

Upon all of this evidence the district court found no reasonable interchangeability or cross-elasticity of demand as between cans and glass containers for packaging food. This finding was clearly correct.

II.

The district court was correct in finding that there was no evidence of reasonable probability of anti-competitive effects resulting from the acquisition.

The district court construed the words "may be", used in Section 7 in defining the effect on competition of mergers, as the equivalent of reasonable probability (Op. R. 1579). There is no doubt that this is correct. The Senate Report on the bill which became Section 7 says, with respect to the words "may be": "The use of these words means that the bill, if enacted, would not apply to the mere possibility but only to the reasonable probability of the prescribed effect." (S. Rep. No. 1775, 81st Cong. 2d Sess. 6; *Brown Shoe*, 370 U. S. at 323).

Although the present case was tried more than four years after the acquisition, there was no proof of actual anti-competitive effects. The government does not dispute this.[28]

The inquiry then becomes one of the reasonable probability of the future development of anti-competitive effects where no such effects have developed in four years. "[T]he

---

[28] During the pre-trial proceedings, the Antitrust Division of the Department of Justice wrote to counsel for appellee:

> "Judge Bryan, at the pre-trial conference of March 4, 1960, ordered the Government to state which of its witnesses would testify that they had received a specific injury as a result of the acquisition of Hazel-Atlas Glass Company by Continental Can Company, Inc.
>
> ". . . As of this date the plaintiff has no witness who will testify as to such specific injury. . . ." (Letter, dated March 17, 1960, from Robert A. Bicks, Acting Assistant Attorney General, Antitrust Division, Department of Justice, to Helmer R. Johnson (unprinted)).

No witness did so testify.

experience reflected by this post-acquisition period must weigh heavily in appraising future probabilities" *Consolidated Foods Corp.* v. *F. T. C.*, 1964 Trade Cases (CCH) ¶71,054, p. 79,168 (7th Cir. 1964).

Although it found no single line of commerce comprising all metal cans and glass containers, and no line of commerce consisting of containers for canning, the district court proceeded to make a very careful and complete appraisal of the effect of the acquisition in every direction, interindustry and intraindustry. Each of the areas in which the government contended that anti-competitive effects might arise was considered separately. The thoroughness of this study is indicated by the areas considered:

(a) Prior acquisitions (Op. R. 1610).

(b) Intention of the parties (Op. R. 1611).

(c) Likelihood of suppression of product lines (Op. R. 1611-12).

(d) Elimination of competition (Op. R. 1611-12, 1620, 1626).

(e) Weakening of either company in their respective lines (Op. R. 1611-12).

(f) Advantages resulting from the acquisition (Op. R. 1612-13, 1619-20, 1625-26).

(g) Concentration in the respective industries (Op. R. 1613-14).

(h) Changes in market position (Op. R. 1614).

(i) Effects on competitors (Op. R. 1615).

(j) Ease of entry into industries involved (Op. R. 1620, 1623).

(k) Tendency toward monopoly (Op. R. 1622-23).

This careful inquiry yielded nothing to show a reasonable probability that the acquisition would have the pro-

hibited anti-competitive effects. There was a total failure of proof that this interindustry merger was likely to adversely affect competition in either industry or in any other line of commerce.

From the mere existence of interindustry competition in general in the sale of cans and glass containers, and the position of Continental and Hazel-Atlas in their respective industries, the government argues that an inference should be drawn that the effect of the acquisition may be substantially to lessen competition (Gov't Brief pp. 24, 52). Here the government seizes upon half a sentence in *United States v. Philadelphia National Bank*[29] and tears it out of context.

The factual situation in *Philadelphia Bank* was completely different from that in the present case. There, both parties to the merger were direct competitors in the same line of commerce (commercial banking), so the merger was plainly a horizontal one. The merger would have produced a bank controlling an undue percentage of the relevant market and would have significantly increased the high degree of concentration that already prevailed in an industry which had witnessed a decline in the number of competitive units. It was in this context that the Court made its comments with respect to the inherent likelihood of the effects of that merger. There is no parallel whatever between the *Philadelphia Bank* case and the merger at issue here, which involves diversification by one company into a new product line.

What the government is saying here in essence is that two large companies, which are important factors in their respective industries,[30] cannot merge if there is interindus-

[29] 374 U. S. 321, 365 (1963).

[30] The government loosely characterizes Continental and Hazel-Atlas as "dominant" firms in their industries. Needless to say, Continental does not dominate an industry in which American Can is the front-runner; nor does Hazel-Atlas dominate an industry in which it trails behind Owens-Illinois and Anchor Hocking.

try competition—wholly apart from either the quantity or quality of such competition, and wholly apart from the roles played by the two companies in that competition. Thus, it is enough for the government that glass and metal containers compete in a general sort of way for some common end uses, and that Hazel-Atlas made glass containers and that Continental made metal containers.

But to what extent do glass and metal containers compete? For which end uses? How important are these end uses in the overall scheme of things? What is the nature and quality of the interindustry competition? In those areas where glass and metal containers can be said to compete, was Hazel-Atlas competing with Continental, and, if so, to what extent?

These are not idle questions. They were considered and answered by the district court. They go to the heart of any meaningful determination of probable anti-competitive effects under Section 7. Yet the government sweeps all these questions under the rug and comes up with a rule of virtual automatic illegality which has no relationship to the realities of the marketplace.

The government oversimplifies. It would treat the merger of a metal container and glass container company in the same way that it would treat the merger of two metal container companies or two glass container companies. It draws no distinction between peripheral interindustry competition and direct intraindustry competition. Manifestly, an attempt by a metal container company to create a can which could be sold for peanut butter, where cans are not now being used to any appreciable degree, is not the same type of competition as that waged among glass container companies going after the same peanut butter business.

We wish to emphasize that we do not contend that evidence of precise market shares is indispensable to proof of a Section 7 violation. It was the government which chose to present a statistical case here. And now that its statistics are deficient, it wants to forget about them. That, of course, is the government's privilege. But when it throws its statistics away and has nothing left, it should not be heard to say that nothing is good enough. The tailor-made rule that it has proposed in this Court for the first time obviates not only the need for statistical proof, but for any proof whatever on the issue of competitive effects.

The government is guilty of the same oversimplification when it comes to its "food canning" line of commerce. It cavalierly assumes, contrary to the evidence, that inter-industry competition *between* metal and glass containers for packaging food products is comparable to competition *within* each of these industries for such packaging purposes. An illustration will serve to point up the fallaciousness of this assumption. Sardines and mayonnaise are both food products. But sardines traditionally move in metal cans, and the housewife traditionally buys mayonnaise in glass containers (DX-N, R. 3389-92, 955). When the metal can manufacturers vie for the custom of a canner who is packing sardines, they most certainly are competing head-on. The same holds true where two glass container manufacturers solicit the patronage of the mayonnaise packer. But would anyone say that in this instance the two metal-can manufacturers are competing with the two glass container manufacturers simply because all four are going after the business of food canners?

The fact of the matter is that to the extent that inter-industry competition exists between glass and metal containers for food canning, it is not the same either qualitatively or quantitatively as the competition that exists within

each of these industries. Hence, even if the government's statistics and statistical assumptions were to be accepted at face value (we demonstrate their utter unreliability in Point III, below), they would not rationally support an inference that the challenged acquisition is reasonably likely to produce the prohibited anti-competitive effects. In other words, if we assume with the government, *arguendo*, that Continental had about 23% and that Hazel-Atlas accounted for approximately 3% of the claimed interindustry "food canning" line of commerce, this would not constitute a *prima facie* violation. We would say that a 3% accretion would not be enough for this purpose under the *Philadelphia National Bank* formulation even if a horizontal merger of direct competitors were involved.[31] *A fortiori*, it is not enough when all that is involved is peripheral interindustry competition.

It is interesting to note that although the government originally contended that the acquisition would substantially lessen competition within both the glass container and metal container industries, it is not appealing from the district court's determination that no such probable anti-competitive effects were shown with respect to either of these lines of commerce. The government, accordingly, is in the position of accepting the finding that intraindustry competition will not be adversely affected by the acquisition, and yet at the same time arguing that interindustry competition will be.

---

[31] A 3% increase would not, we submit, produce "a firm controlling an undue percentage share of the relevant market;" nor would it result in "a significant increase in the concentration of firms in that market." *United States* v. *Philadelphia National Bank*, 374 U. S. 321, 363 (1963). The incremental percentage in the *Philadelphia National Bank* case was several times as large.

III.

The government's statistics are unreliable and provide no basis for measuring shares of any market.

Although the government deprecates reliance on statistics it uses many of them in its brief in an attempt to show what Continental's and Hazel-Atlas' positions would have been if metal cans and glass containers for foods or for canning could have been combined into a single product market from which all other types of containers were excluded.

Its statistical methodology is such, however, that each figure it uses must be examined with care. The record shows that they are false. The district court found that many of the government's statistical combinations "have no sound statistical basis and are predicated on implausible hypotheses not supported by evidence." (Op. R. 1614). The government does not contest this finding; it tries to ignore it.[32]

It is never easy to demonstrate the falsity of statistics, but the record in this case is such as to permit it to be done.

In the first place, the metal can and glass container industries are so different that they do not use a common system of statistical notation. The can industry reports to the Census Bureau in terms of the amount of tinplate consumed; the glass industry in terms of units, by end use categories, shipped. At the trial the government witness presenting its statistics testified that he had never heard of combined figures (R. 1281). He had set about to make his own combinations.[33]

---

[32] In its brief the government contents itself with saying that it explained its computations at the trial (Gov't Brief p. 50 n. 50). It was in response to this explanation that the district court made its finding that they were "predicated on implausible hypotheses".

[33] He was not a qualified statistician (R. 1231-32).

In an attempt to convert the tinplate use to units of metal cans, the government took a series of figures from the can industry's trade association which were clearly marked as the hypothetical number of cans which could have been made from the amount of tinplate consumed.[34] These figures were never used by the trade association without being clearly marked as hypothetical. They were admittedly made without regard to product mix, which the record shows varies greatly from company to company, and by making certain undisclosed assumptions with respect to size of cans and weight of tinplate used in making metal cans (R. 1275-79; GX 800, R. 2937-47, 1490).

From the trade association's hypothetical figure the government computed an assumed conversion factor (one never used by the trade association—R. 1307-08) which it applied to the Census Bureau figures of total tinplate consumed in the making of cans of all sizes and shapes. No attempt was made to allow for variations in sizes of cans, which obviously vary widely.

Using the method described, with its clearly erroneous assumptions, the government then had a figure which it called the total number of units of cans manufactured. To this it added the total number of units of glass containers shipped, counting each unit as one although the record shows that great numbers of the glass containers were returnable bottles used on an average of twenty-two times each (R. 1015-16). The Census Bureau has, for obvious reasons, always carefully separated returnable from non-returnable bottles (R. 1282-83). The largest category of returnable bottles is beer bottles. Since Hazel-

[34] In response to an interrogatory to the government with respect to these figures, it said: "[T]he plaintiff has no way of verifying their accuracy." (DX-X, R. 3401, 1495).

Atlas' production of beer bottles was negligible, the distortion was extremely large.

To this artificially constructed universe figure the government applied Continental's usage of tinplate, similarly converted into hypothetical units, and Hazel-Atlas' production of units of glass containers, to get a percentage of the total. This percentage was carried out beyond the decimal point to give an appearance of exactitude.

The percentage figures have no relationship to reality. They are false.

At the trial the government attempted to construct figures showing Continental's and Hazel-Atlas' share of containers used in "food canning." It now recognizes that it failed in this (Gov't Brief pp. 49-52), but it proposes a totally unfounded assumption that the proportion would be the same as the proportion of the whole. Even if the stated proportion of the whole were reliable, which it clearly is not, this assumption would be untenable for the product mix of each of the two companies was entirely different from the rest of their respective industries.[35]

The government, recognizing the weakness of its statistics, says that in any event they are "accurate enough"

---

[35] The absurdity of the "inference that leading producers in each of these industries were able to sell their products in roughly equal shares among the major possible end uses because of the flexibility of manufacture and use" (Gov't Brief p. 51), can be demonstrated in another way. The same logic would support the inference that Hazel-Atlas produced beer bottles and milk bottles in the same proportion as its percentage of the glass container market. Yet the record shows that it produced a negligible number of beer bottles and no milk bottles (R. 354-55; GX 801, R. 2959, 2970, 1465, 1489; GX 800, R. 2884, 1490).

In its reply brief in the *Owens-Illinois* case, referred to above (p. 30), the government itself, citing *Crown Zellerbach Corp.* v. *F. T. C.*, 296 F. 2d 800, 812 (9th Cir. 1961) *cert. denied*, 370 U. S. 937 (1962), labelled the production flexibility theory, which it here advocates, an "absurdity."

(Gov't Brief p. 50). They are neither accurate nor accurate enough for any purpose, because they are based on inherently unsupportable assumptions. We are fully mindful of this Court's observation that "in cases of this type precision in detail is less important than the accuracy of the broad picture presented." *Brown Shoe Co.* v. *United States*, 370 U. S. 294 (1962). So was the court below. The trouble with the government's statistics is not merely that they are imprecise; the trouble is that they are meaningless.

As a last resort, the government begs to be allowed to use its statistics "if Section 7 litigation is to remain manageable" (Gov't Brief p. 49). The exigencies of litigation are, we submit, no justification for the use of made-to-order, tailored statistics which are palpably false, misleading and unreliable.

Conclusion.

In an extremely conscientious examination of the law and the facts the district court found that there had been a failure to prove any violation of Section 7. The appeal presents no questions of law for this Court's review. This is a fact case pure and simple. The government would have this Court examine *de novo* a large record compiled in a lengthy pre-trial and trial, and make new findings in place of those made by the trier of facts, who spent large amounts of time over a period of several years in their preparation. Under Rule 52(a) those findings cannot be set aside unless they are clearly erroneous. No such showing has even been attempted, much less made, here.

The situation here is comparable to that in *United States* v. *Yellow Cab Co.*, 338 U. S. 338 (1949) in which this

Court, in refusing to retry an antitrust case, concluded at 340-41:

> "The judgment below is supported by an opinion, prepared with obvious care, which analyzes the evidence and shows the reasons for the findings. To us it appears to represent the considered judgment of an able trial judge, after patient hearing, that the Government's evidence fell short of its allegations—a not uncommon form of litigation casualty, from which the Government is no more immune than others."

The judgment of the district court should be affirmed.

Respectfully submitted,

Helmer R. Johnson,
Mark F. Hughes,
Willkie Farr Gallagher Walton & FitzGibbon
1 Chase Manhattan Plaza
New York, N. Y. 10005
Attorneys for Appellee Continental Can Company, Inc.

April 17, 1964.

Appellee's Appendix.

(Stipulation—R. 1160-61).

The plaintiff stipulates that if the remaining FBI witnesses which it will call to testify were cross examined with respect to the following matters each of them would answer substantially as follows:

That he had never been employed by a can manufacturer, a glass container manufacturer, a plastic container manufacturer or a firm engaged in conducting surveys or polls of public opinions or consumer preference, and that he is not experienced in the techniques of such polls or surveys;

That he has never been employed by a packer who uses any of the kinds of containers that he observed during the course of his assignment;

That he has not been in communication with any of the packers whose products he has stated that he observed;

That he is not a chemist;

That he does not know the difference between high-density and low-density polyethylene, nor the difference between either of them and polystyrene;

That he took no note of and made no list of products in the stores which he visited which were packed in only one type of container;

That he took no note of and made no record of prices of the products which he observed;

That he took no note of and made no record of the quantities of products in the containers he observed;

That he took no note of and made no record of the quality of the products in the containers he observed;

That he took no note of and made no record of the differences in the preparation of the products in the containers he observed;

That he could not say whether the products which he observed were specially packed for special purposes, such as, for example, dietetic purposes;

That he did not know whether any of the products which he observed were processed by heat sterilization;

That he made no observation as to the amount of shelf space devoted to the different types of containers used to package what he considered to be similar products;

That he has no information as to the quantities of any of the products which he observed in inventory in any store, or as to the quantities sold in any store in any period of time, or as to the quantities sold in the metropolitan area of the community in which the observations were made, or as to the quantities sold in the United States at any time;

That he has no information with respect to the formulation of any of the products which he observed to be packaged in cans or glass or plastic;

That he did not notice whether any of the products which he observed were packaged locally or at a distance;

That he could not tell from the package of any article which he observed whether or not it was being test-marketed, or whether or not it was obsolete stock, or whether or not it had been packed as an experiment, or whether or not it was on special sale on the date of the observation;

That he couldn't tell from the package of any article which he observed whether or not the packager who packaged it is still packing in the same type of container;

That he could not tell from the package of the products that he observed or from any other source why the packer chose the particular type of package for the product;

That in the case of stores whose principal business is the sale of foods, he noticed that they carried fresh fruits and vegetables, fresh meats and fresh dairy products, that they carried frozen foods and foods in dried or dehydrated forms, but that he made no particular observations as to what the particular products were;

That he has no information as to the method of processing the various products he observed and no information as to the method of filling the containers he observed.
